CC   -!- FUNCTION: BOTULINUS TOXIN ACTS BY INHIBITING NEUROTRANSMITTER
CC       RELEASE. IT BINDS TO PERIPHERAL NEURONAL SYNAPSES, IS INTERNALIZED
CC       AND MOVES BY RETROGRADE TRANSPORT UP THE AXON INTO THE SPINAL CORD
CC       WHERE IT CAN MOVE BETWEEN POSTSYNAPTIC AND PRESYNAPTIC NEURONS. IT
CC       INHIBITS NEUROTRANSMITTER RELEASE BY ACTING AS A ZINC
CC       ENDOPEPTIDASE THAT CLEAVES SYNTAXIN.
CC   -!- CATALYTIC ACTIVITY: Limited hydrolysis of proteins of the
CC       neuroexocytosis apparatus, synaptobrevins, SNAP25 or syntaxin. No
CC       detected action on small molecule substrates.
CC   -!- COFACTOR: Binds 1 zinc ion per subunit (By similarity).
```

```
CC   -!- SUBUNIT: Disulfide-linked heterodimer of a light chain (L) and a
CC       heavy chain (H). The light chain has the pharmacological activity,
CC       while the N- and C-terminal of the heavy chain mediate channel
CC       formation and toxin binding, respectively.
CC   -!- SUBCELLULAR LOCATION: Secreted.
CC   -!- MISCELLANEOUS: There are seven antigenically distinct forms of
CC       botulinum neurotoxin: Types A, B, C1, D, E, F, and G.
CC   -!- MISCELLANEOUS: BOTULINUM TYPE C1 NEUROTOXIN IS SYNTHESIZED BY C
CC       STRAIN OF CLOSTRIDIUM BOTULINUM WHICH CARRY THE APPROPRIATE
CC       BACTERIOPHAGE.
CC   -!- SIMILARITY: Belongs to peptidase family M27.

CC   -!- FUNCTION: Role in mesoderm induction and its earliest regional
CC       specification, somitogenesis, and myogenic and sclerotomal
CC       differentiation. May have a regulatory role when quiescent
CC       vascular smooth muscle cells reenter the cell cycle.
CC   -!- SUBCELLULAR LOCATION: Nuclear (Potential).
CC   -!- DEVELOPMENTAL STAGE: It is not expressed before 8-8.5 dpc. At 8-
CC       8.5 dpc it is found on the entire epithelium of the somite. At 9.5
CC       dpc its expression is restricted to the sclerotome. At 10.5 dpc it
CC       is found in sclerotomally derived cells including the vertebral
CC       and costal precursors.
CC   -!- SIMILARITY: Contains 1 homeobox domain.

RA   Vaccarino F.M.;
RT   "Fibroblast growth factor 2 increases Otx2 expression in precursor
RT   cells from mammalian telencephalon.";
RL   J. Neurosci. 15:7879-7891(1995).
CC   -!- FUNCTION: Probably play a role in the development of the brain and
CC       the sense organs. Can bind to the BCD target sequence (BTS): 5'-
CC       TCTAATCCC-3' (By similarity). May play a role in the specification
CC       or differentiation of neurons in the deep layers of the cerebral
CC       cortex, and also in cerebellar regionalization during early
CC       development.
CC   -!- SUBCELLULAR LOCATION: Nuclear (Probable).
CC   -!- TISSUE SPECIFICITY: Brain: restricted regions of the developing
CC       rostral brain including the presumptive cerebral cortex and
CC       olfactory bulbs; expressed in the developing olfactory, auricolar
CC       and ocular systems, including the covering of the optic nerve (By
CC       similarity).
CC   -!- DEVELOPMENTAL STAGE: Expressed throughout the forebrain and
CC       midbrain during development, and in addition is also seen in
CC       discrete spatial and temporal domains in the developing cerebral
CC       cortex and cerebellum. Confined to a subpopulation of neurons in
CC       layers 5 and 6 within the adult cerebral cortex and during
CC       development expression is high in the progenitors of these deep-
CC       layer cells. Expressed in the developing cerebellum in spatially
CC       restricted regions of the external granular layer.
CC   -!- SIMILARITY: Belongs to the paired homeobox family. Bicoid
CC       subfamily.
CC   -!- SIMILARITY: Contains 1 homeobox domain.

CC   -!- FUNCTION: BOTULINUS TOXIN ACTS BY INHIBITING NEUROTRANSMITTER
CC       RELEASE. IT BINDS TO PERIPHERAL NEURONAL SYNAPSES, IS INTERNALIZED
CC       AND MOVES BY RETROGRADE TRANSPORT UP THE AXON INTO THE SPINAL CORD
CC       WHERE IT CAN MOVE BETWEEN POSTSYNAPTIC AND PRESYNAPTIC NEURONS. IT
CC       INHIBITS NEUROTRANSMITTER RELEASE BY ACTING AS A ZINC
CC       ENDOPEPTIDASE THAT CLEAVES THE 60-LYS-|-LEU-61 BOND OF
CC       SYNAPTOBREVINS-1 AND -2.
CC   -!- CATALYTIC ACTIVITY: Limited hydrolysis of proteins of the
CC       neuroexocytosis apparatus, synaptobrevins, SNAP25 or syntaxin. No
CC       detected action on small molecule substrates.
CC   -!- COFACTOR: Binds 1 zinc ion per subunit (By similarity).
CC   -!- SUBUNIT: Disulfide-linked heterodimer of a light chain (L) and a
CC       heavy chain (H). The light chain has the pharmacological activity,
CC       while the N- and C-terminal of the heavy chain mediate channel
CC       formation and toxin binding, respectively.
CC   -!- SUBCELLULAR LOCATION: Secreted.
CC   -!- MISCELLANEOUS: There are seven antigenically distinct forms of
CC       botulinum neurotoxin: Types A, B, C1, D, E, F, and G.
CC   -!- MISCELLANEOUS: BOTULINUM TYPE D NEUROTOXIN IS SYNTHESIZED BY D
CC       STRAIN OF CLOSTRIDIUM BOTULINUM WHICH CARRY THE APPROPRIATE
CC       BACTERIOPHAGE.
CC   -!- SIMILARITY: Belongs to peptidase family M27.

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

PT Host cell containing recombinant expression vector encoding Clostridium
PT botulinum type B or E toxin - useful to treat humans and other animals at
PT risk of intoxication with clostridial toxin.
XX
PS Example 45; Page 339-341; 428pp; English.
XX
CC This is the amino acid sequence of the histidine-tagged C fragment of
CC Clostridium botulinum (Stockholm strain) type C1 neurotoxin, encoded by a
CC DNA sequence (see AAV30588) in plasmid pETHisb. This vector is used to
CC express BotC soluble C fragment in Escherichia coli host cells, and the
CC recombinant C fragment was purified on an affinity column. The invention
CC relates to recombinant proteins derived from C. botulinum toxins,
CC especially type B and type E toxins. Methods are provided which allow for

```
CC   the isolation of soluble recombinant proteins free of significant
CC   endotoxin contamination. Preferred hosts for production of recombinant
CC   proteins are E. coli, insect cells and yeast cells. The recombinant
CC   toxins are used as immunogens for the production of vaccines and
CC   antitoxins that are useful in the treatment of humans and animals at risk
CC   of intoxication with clostridial toxin

PT   Novel Botulinum neurotoxin vaccine comprising a fragment from botulinum
PT   toxin serotypes A-G, is used for inducing an immune response against
PT   botulinum.
XX
PS   Claim 24; Page 41-42; 54pp; English.
XX
CC   The invention relates to novel vaccines that induce a protective immune
CC   response against botulinum neurotoxin (BoNT) serotypes A, B, C, D, E, F
CC   and G (BoNTA-BoNTG). The vaccine of the invention is novel recombinant
CC   DNA construct comprising a vector, and at least one nucleic acid fragment
CC   comprising a C-terminal heavy chain fragment (Hc) from BoNT serotypes A-
CC   G. In preferred embodiments of the invention, the vector is a Venezuelan
CC   equine encephalitis virus (VEE) replicon vector. Use of this vector
CC   results in the production of large amounts of a protein encoded by a
CC   sequence cloned into the replicon. The constructs are used to produce
CC   vaccines against botulism. The proteins can also be used as diagnostic
CC   tools for the diagnosis of botulism. The transformed host cells can be
CC   used to analyse the effectiveness of drugs and agents which inhibit toxin
CC   effects. The vaccine currently used against botulism is dangerous and
CC   expensive to produce, and contains formalin, which is very painful for
CC   the recipient. Also, the vaccine is incomplete, in that only 5 of the 7
CC   serotypes are represented in the formulation. The novel vaccine of
CC   overcomes these problems, as it is easily purified, and available in
CC   large quantities. It is also expressed in the lymph nodes for a better
CC   immune response. Sequences AAY77134-Y77139 represent synthetic BoNT Hc
CC   fragments used in the present invention. The DNA encoding these sequences
CC   had been optimised for codon usage for expression in yeast

PT   New nucleic acids encoding the carboxy- or amino-terminal portions of the
PT   heavy chain of botulinum neurotoxin of serotype A-G, useful as vaccine
PT   against botulism.
XX
PS   Claim 3; Fig 5b; 73pp; English.
XX
CC   Botulism neurotoxins are translated as a single 150 kDa polypeptide chain
CC   and then posttranslationally nicked, forming a dichain consisting of a
CC   100 kDa heavy chain and a 50 kDa light chain which remain linked by a
CC   disulfide bond. Nucleic acids encoding the carboxy-terminal (HC) or amino
CC   -terminal (HN) portion of the heavy chain of botulinum neurotoxin (BoNT)
CC   can be used in recombinant expression vectors and expressed in
CC   transformed cells to produce peptide antigens useful for eliciting an
CC   immune response to give protective immunity against botulinum neurotoxin,
CC   which causes botulism. The nucleic acids are expressible in a recombinant
CC   organisms such as Escherichia coli or Pichia pastoris. The use of
CC   recombinant nucleic acids are advantageous since it eliminates the need
CC   to culture large quantities of hazardous toxin-producing bacterium.
CC   Production yield from the genetically engineered product is also high and
CC   cost of production is lower. The nucleic acids can be derived from
CC   Clostridium botulinum serotypes A-G

PT   Modified toxin useful for systemic delivery of oral vaccines and
PT   therapeutic agents.
XX
PS   Example 1; Page 31-33; 37pp; English.
XX
CC   The present sequence represents a modified serotype C botulinum toxin,
CC   termed rBoNT/C, in which amino acids His-229, Glu-230 and His-233 of the
CC   native sequence are substituted by Gly, Thr and Asn, respectively, i.e.
CC   the zinc binding motif (see AAY05817) of the light chain holotoxin is
```

```
CC   modified, resulting in loss of endoprotease activity. DNA coding for the
CC   modified botulinum toxin (see AAX25521) was assembled from 3 separate
CC   toxin fragments using PCR and site-directed mutagenesis. The modified
CC   recombinant botulinum toxin maintains its ability to translocate from the
CC   gut into the general circulation but is non-toxic. It can be used as an
CC   oral vaccine for antigenic peptides including botulinum toxin (i.e. an
CC   oral vaccine for botulism) or for the oral delivery of other therapeutic
CC   agents to the general circulation

PT   Non-toxic immunogenic derivative of Clostridium botulinum neurotoxin type
PT   D, useful in vaccines for protection against botulism, comprises at least
PT   one amino acid mutation not present in the wild type D neurotoxins.
XX
PS   Claim 3, 4; Page 54-57; 66pp; English.
XX
CC   This sequence represents the amino acid sequence of a synthetic non-toxic
CC   immunogenic derivative of Clostridium botulinum type D toxin (BoNT).
CC   Botulinum neurotoxin causes botulism poisoning in cattle and sheep, and
CC   usually results in the death of the affected or poisoned animal. The non-
CC   toxic immunogenic fragments of the C. botulinum neurotoxin are useful in
CC   vaccines to protect animals (e.g. humans, cattle, sheep, pigs) against
CC   BoNT type D poisoning. The non-toxic fragments can be produced relatively
CC   simply and inexpensively (specifically by fermentation techniques). As
CC   the fragments are not toxic the risk to production staff is reduced

PT   Host cell containing recombinant expression vector encoding Clostridium
PT   botulinum type B or E toxin - useful to treat humans and other animals at
PT   risk of intoxication with clostridial toxin.
XX
PS   Example 47; Page 352-353; 428pp; English.
XX
CC   This is the amino acid sequence of the histidine-tagged C fragment of
CC   Clostridium botulinum seotype D neurotoxin, encoded by a DNA sequence
CC   (see AAV30591) in plasmid pETHisb. This vector can be used to express
CC   BotD soluble C fragment in Escherichia coli host cells, with the
CC   recombinant C fragment being purified on an affinity column. The
CC   invention relates to recombinant proteins derived from C. botulinum
CC   toxins, especially type B and type E toxins. Methods are provided which
CC   allow for the isolation of soluble recombinant proteins free of
CC   significant endotoxin contamination. Preferred hosts are E. coli, insect
CC   cells and yeast cells. The recombinant toxins are used as immunogens for
CC   the production of vaccines and antitoxins useful in the treatment of
CC   humans and animals at risk of intoxication with clostridial toxin

PT   New nucleic acids encoding the carboxy- or amino-terminal portions of the
PT   heavy chain of botulinum neurotoxin of serotype A-G, useful as vaccine
PT   against botulism.
XX
PS   Claim 3; Fig 6b; 73pp; English.
XX
CC   Botulism neurotoxins are translated as a single 150 kDa polypeptide chain
CC   and then posttranslationally nicked, forming a dichain consisting of a
CC   100 kDa heavy chain and a 50 kDa light chain which remain linked by a
CC   disulfide bond. Nucleic acids encoding the carboxy-terminal (HC) or amino
CC   -terminal (HN) portion of the heavy chain of botulinum neurotoxin (BoNT)
CC   can be used in recombinant expression vectors and expressed in
CC   transformed cells to produce peptide antigens useful for eliciting an
CC   immune response to give protective immunity against botulinum neurotoxin,
CC   which causes botulism. The nucleic acids are expressible in a recombinant
CC   organisms such as Escherichia coli or Pichia pastoris. The use of
CC   recombinant nucleic acids are advantageous since it eliminates the need
CC   to culture large quantities of hazardous toxin-producing bacterium.
CC   Production yield from the genetically engineered product is also high and
CC   cost of production is lower. The nucleic acids can be derived from
CC   Clostridium botulinum serotypes A-G

PS Example 49; Page 376-378; 428pp; English.
XX
CC This is the amino acid sequence of the histidine-tagged C fragment of
CC Clostridium botulinum (113/30 strain) type G neurotoxin, encoded by a DNA
CC sequence (see AAV30596) in plasmid pETHisb. This vector can be used to
CC express BotG soluble C fragment in Escherichia coli host cells, with the
CC recombinant C fragment being purified on an affinity column. The
CC invention relates to recombinant proteins derived from C. botulinum
CC toxins, especially type B and type E toxins. Methods are provided which
CC allow for the isolation of soluble recombinant proteins free of
CC significant endotoxin contamination. Preferred hosts for production of
CC recombinant proteins are E. coli, insect cells and yeast cells. The
CC recombinant toxins are used as immunogens for the production of vaccines
CC and antitoxins that are useful in the treatment of humans and animals at
CC risk of intoxication with clostridial toxin

XX
CC This is the amino acid sequence of the histidine-tagged C fragment of
CC Clostridium botulinum (Eklund 17B strain) type B toxin, encoded by a DNA
CC sequence (see AAV30580) in plasmid pHisBotb. This vector was used to
CC express soluble C fragment in Escherichia coli host cells, and the
CC recombinant C fragment was purified on an affinity column. The invention
CC relates to recombinant proteins derived from C. botulinum toxins. Methods
CC are provided which allow for the isolation of soluble recombinant
CC proteins free of significant endotoxin contamination. Preferred hosts for
CC production of recombinant proteins are E. coli, insect cells and yeast
CC cells. The recombinant toxins are used as immunogens for the production
CC of vaccines and antitoxins that are useful in the treatment of humans and
CC animals at risk of intoxication with clostridial toxin

PT   Host cell containing recombinant expression vector encoding Clostridium
PT   botulinum type B or E toxin - useful to treat humans and other animals at
PT   risk of intoxication with clostridial toxin.
XX
PS   Example 48; Page 364-365; 428pp; English.
XX
CC   This is the amino acid sequence of the histidine-tagged C fragment of
CC   Clostridium botulinum (202F strain) type F neurotoxin, encoded by a DNA
CC   sequence (see AAV30593) in plasmid pETHisb. This vector can be used to
CC   express BotC soluble C fragment in Escherichia coli host cells, with the
CC   recombinant C fragment being purified on an affinity column. The
CC   invention relates to recombinant proteins derived from C. botulinum
CC   toxins, especially type B and type E toxins. Methods are provided which
CC   allow for the isolation of soluble recombinant proteins free of
CC   significant endotoxin contamination. Preferred hosts for production of
CC   recombinant proteins are E. coli, insect cells and yeast cells. The
CC   recombinant toxins are used as immunogens for the production of vaccines
CC   and antitoxins that are useful in the treatment of humans and animals at
CC   risk of intoxication with clostridial toxin

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

CC -!- FUNCTION: BOTULINUS TOXIN ACTS BY INHIBITING NEUROTRANSMITTER
CC RELEASE. IT BINDS TO PERIPHERAL NEURONAL SYNAPSES, IS INTERNALIZED
CC AND MOVES BY RETROGRADE TRANSPORT UP THE AXON INTO THE SPINAL CORD
CC WHERE IT CAN MOVE BETWEEN POSTSYNAPTIC AND PRESYNAPTIC NEURONS. IT
CC INHIBITS NEUROTRANSMITTER RELEASE BY ACTING AS A ZINC
CC ENDOPEPTIDASE THAT CLEAVES SYNTAXIN.
CC -!- CATALYTIC ACTIVITY: Limited hydrolysis of proteins of the
CC neuroexocytosis apparatus, synaptobrevins, SNAP25 or syntaxin. No
CC detected action on small molecule substrates.
CC -!- COFACTOR: Binds 1 zinc ion per subunit (By similarity).

```
CC   -!- SUBUNIT: Disulfide-linked heterodimer of a light chain (L) and a
CC       heavy chain (H). The light chain has the pharmacological activity,
CC       while the N- and C-terminal of the heavy chain mediate channel
CC       formation and toxin binding, respectively.
CC   -!- SUBCELLULAR LOCATION: Secreted.
CC   -!- MISCELLANEOUS: There are seven antigenically distinct forms of
CC       botulinum neurotoxin: Types A, B, C1, D, E, F, and G.
CC   -!- MISCELLANEOUS: BOTULINUM TYPE C1 NEUROTOXIN IS SYNTHESIZED BY C
CC       STRAIN OF CLOSTRIDIUM BOTULINUM WHICH CARRY THE APPROPRIATE
CC       BACTERIOPHAGE.
CC   -!- SIMILARITY: Belongs to peptidase family M27.

CC   -!- FUNCTION: BOTULINUS TOXIN ACTS BY INHIBITING NEUROTRANSMITTER
CC       RELEASE. IT BINDS TO PERIPHERAL NEURONAL SYNAPSES, IS INTERNALIZED
CC       AND MOVES BY RETROGRADE TRANSPORT UP THE AXON INTO THE SPINAL CORD
CC       WHERE IT CAN MOVE BETWEEN POSTSYNAPTIC AND PRESYNAPTIC NEURONS. IT
CC       INHIBITS NEUROTRANSMITTER RELEASE BY ACTING AS A ZINC
CC       ENDOPEPTIDASE.
CC   -!- CATALYTIC ACTIVITY: Limited hydrolysis of proteins of the
CC       neuroexocytosis apparatus, synaptobrevins, SNAP25 or syntaxin. No
CC       detected action on small molecule substrates.
CC   -!- COFACTOR: Binds 1 zinc ion per subunit (By similarity).
CC   -!- SUBUNIT: Disulfide-linked heterodimer of a light chain (L) and a
CC       heavy chain (H). The light chain has the pharmacological activity,
CC       while the N- and C-terminal of the heavy chain mediate channel
CC       formation and toxin binding, respectively.
CC   -!- SUBCELLULAR LOCATION: Secreted.
CC   -!- MISCELLANEOUS: There are seven antigenically distinct forms of
CC       botulinum neurotoxin: Types A, B, C1, D, E, F, and G.
CC   -!- SIMILARITY: Belongs to peptidase family M27.

RT   "Crystal structure of botulinum neurotoxin type A and implications
RT   for toxicity.";
RL   Nat. Struct. Biol. 5:898-902(1998).
CC   -!- FUNCTION: Inhibits acetylcholine release. The botulinum toxin
CC       binds with high affinity to peripheral neuronal presynaptic
CC       membrane, is then internalized by receptor-mediated endocytosis.
CC       The C-terminus of the heavy chain (H) is responsible for the
CC       adherence of the toxin to the cell surface while the N-terminus
CC       mediates transport of the light chain from the endocytic vesicle
CC       to the cytosol. After translocation, the light chain (L)
CC       hydrolyzes the 197-Gln-|-Arg-198 bond in SNAP-25, thereby blocking
CC       neurotransmitter release. Inhibition of acetylcholine release
CC       results in flaccid paralysis, with frequent heart or respiratory
CC       failure.
CC   -!- CATALYTIC ACTIVITY: Limited hydrolysis of proteins of the
CC       neuroexocytosis apparatus, synaptobrevins, SNAP25 or syntaxin. No
CC       detected action on small molecule substrates.
CC   -!- COFACTOR: Binds 1 zinc ion per subunit.
CC   -!- SUBUNIT: Disulfide-linked heterodimer of a light chain (L) and a
CC       heavy chain (H).
CC   -!- SUBCELLULAR LOCATION: Secreted.
CC   -!- PHARMACEUTICAL: Available under the name BOTOX (Allergan) for
CC       the treatment of strabismus and blepharospasm associated with
CC       dystonia and cervical dystonia. Also used for the treatment of
CC       hemifacial spasm and a number of other neurological disorders
CC       characterized by abnormal muscle contraction.
CC   -!- MISCELLANEOUS: There are seven antigenically distinct forms of
CC       botulinum neurotoxin: Types A, B, C1, D, E, F, and G.
CC   -!- SIMILARITY: Belongs to peptidase family M27.

CC   -!- FUNCTION: Inhibits acetylcholine release. The botulinum toxin
CC       binds with high affinity to peripheral neuronal presynaptic
CC       membrane, is then internalized by receptor-mediated endocytosis.
CC       The C-terminus of the heavy chain (H) is responsible for the
CC       adherence of the toxin to the cell surface while the N-terminus
CC       mediates transport of the light chain from the endocytic vesicle
CC       to the cytosol. After translocation, the light chain (L)
CC       hydrolyzes the 197-Gln-|-Arg-198 bond in SNAP-25, thereby blocking
CC       neurotransmitter release. Inhibition of acetylcholine release
CC       results in flaccid paralysis, with frequent heart or respiratory
CC       failure (By similarity).
CC   -!- CATALYTIC ACTIVITY: Limited hydrolysis of proteins of the
CC       neuroexocytosis apparatus, synaptobrevins, SNAP25 or syntaxin. No
CC       detected action on small molecule substrates.
CC   -!- SUBUNIT: Disulfide-linked heterodimer of a light chain (L) and a
CC       heavy chain (H) (By similarity).
CC   -!- SUBCELLULAR LOCATION: Secreted.
CC   -!- MISCELLANEOUS: There are seven antigenically distinct forms of
CC       botulinum neurotoxin: Types A, B, C1, D, E, F, and G.
CC   -!- SIMILARITY: Belongs to peptidase family M27.

CC   -!- FUNCTION: BOTULINUS TOXIN ACTS BY INHIBITING NEUROTRANSMITTER
CC       RELEASE. IT BINDS TO PERIPHERAL NEURONAL SYNAPSES, IS INTERNALIZED
CC       AND MOVES BY RETROGRADE TRANSPORT UP THE AXON INTO THE SPINAL CORD
CC       WHERE IT CAN MOVE BETWEEN POSTSYNAPTIC AND PRESYNAPTIC NEURONS. IT
CC       INHIBITS NEUROTRANSMITTER RELEASE BY ACTING AS A ZINC
CC       ENDOPEPTIDASE THAT CATALYZES THE HYDROLYSIS OF THE 58-GLN-|-LYS-59
CC       BOND OF SYNAPTOBREVINS-1 AND -2.
CC   -!- CATALYTIC ACTIVITY: Limited hydrolysis of proteins of the
CC       neuroexocytosis apparatus, synaptobrevins, SNAP25 or syntaxin. No
CC       detected action on small molecule substrates.
CC   -!- COFACTOR: Binds 1 zinc ion per subunit (By similarity).
CC   -!- SUBUNIT: Disulfide-linked heterodimer of a light chain (L) and a
CC       heavy chain (H). The light chain has the pharmacological activity,
CC       while the N- and C-terminal of the heavy chain mediate channel
CC       formation and toxin binding, respectively.
CC   -!- SUBCELLULAR LOCATION: Secreted.
CC   -!- MISCELLANEOUS: There are seven antigenically distinct forms of
CC       botulinum neurotoxin: Types A, B, C1, D, E, F, and G.
CC   -!- SIMILARITY: Belongs to peptidase family M27.

CC   -!- FUNCTION: TETANUS TOXIN ACTS BY INHIBITING NEUROTRANSMITTER
CC       RELEASE. IT BINDS TO PERIPHERAL NEURONAL SYNAPSES, IS INTERNALIZED
CC       AND MOVES BY RETROGRADE TRANSPORT UP THE AXON INTO THE SPINAL CORD
CC       WHERE IT CAN MOVE BETWEEN POSTSYNAPTIC AND PRESYNAPTIC NEURONS. IT
CC       INHIBITS NEUROTRANSMITTER RELEASE BY ACTING AS A ZINC
CC       ENDOPEPTIDASE THAT CATALYZES THE HYDROLYSIS OF THE 76-GLN-|-PHE-77
CC       BOND OF SYNAPTOBREVIN-2.
CC   -!- CATALYTIC ACTIVITY: Hydrolysis of 76-Gln-|-Phe-77 bond in
CC       synaptobrevin 2.
CC   -!- COFACTOR: Binds 1 zinc ion per subunit (By similarity).
CC   -!- SUBUNIT: THE PRECURSOR POLYPEPTIDE IS SUBSEQUENTLY CLEAVED TO
CC       YIELD SUBCHAINS L AND H. THESE REMAIN LINKED BY A DISULFIDE BRIDGE
CC       AND ARE NON-TOXIC AFTER SEPARATION.
CC   -!- MISCELLANEOUS: THE C-TERMINAL OF THE HEAVY CHAIN BINDS TO
CC       GANGLIOSIDE RECEPTORS.
CC   -!- SIMILARITY: Belongs to peptidase family M27.

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

PT Host cell containing recombinant expression vector encoding Clostridium
PT botulinum type B or E toxin - useful to treat humans and other animals at
PT risk of intoxication with clostridial toxin.
XX
PS Example 47; Page 352-353; 428pp; English.
XX
CC This is the amino acid sequence of the histidine-tagged C fragment of
CC Clostridium botulinum seotype D neurotoxin, encoded by a DNA sequence
CC (see AAV30591) in plasmid pETHisb. This vector can be used to express
CC BotD soluble C fragment in Escherichia coli host cells, with the
CC recombinant C fragment being purified on an affinity column. The
CC invention relates to recombinant proteins derived from C. botulinum
CC toxins, especially type B and type E toxins. Methods are provided which

```
CC   allow for the isolation of soluble recombinant proteins free of
CC   significant endotoxin contamination. Preferred hosts are E. coli, insect
CC   cells and yeast cells. The recombinant toxins are used as immunogens for
CC   the production of vaccines and antitoxins useful in the treatment of
CC   humans and animals at risk of intoxication with clostridial toxin

PT   New nucleic acids encoding the carboxy- or amino-terminal portions of the
PT   heavy chain of botulinum neurotoxin of serotype A-G, useful as vaccine
PT   against botulism.
XX
PS   Claim 3; Fig 6b; 73pp; English.
XX
CC   Botulism neurotoxins are translated as a single 150 kDa polypeptide chain
CC   and then posttranslationally nicked, forming a dichain consisting of a
CC   100 kDa heavy chain and a 50 kDa light chain which remain linked by a
CC   disulfide bond. Nucleic acids encoding the carboxy-terminal (HC) or amino
CC   -terminal (HN) portion of the heavy chain of botulinum neurotoxin (BoNT)
CC   can be used in recombinant expression vectors and expressed in
CC   transformed cells to produce peptide antigens useful for eliciting an
CC   immune response to give protective immunity against botulinum neurotoxin,
CC   which causes botulism. The nucleic acids are expressible in a recombinant
CC   organisms such as Escherichia coli or Pichia pastoris. The use of
CC   recombinant nucleic acids are advantageous since it eliminates the need
CC   to culture large quantities of hazardous toxin-producing bacterium.
CC   Production yield from the genetically engineered product is also high and
CC   cost of production is lower. The nucleic acids can be derived from
CC   Clostridium botulinum serotypes A-G

PT   Host cell containing recombinant expression vector encoding Clostridium
PT   botulinum type B or E toxin - useful to treat humans and other animals at
PT   risk of intoxication with clostridial toxin.
XX
PS   Example 35; Page 303-305; 428pp; English.
XX
CC   This is the amino acid sequence of the histidine-tagged C fragment of
CC   Clostridium botulinum (Danish strain) type B toxin, encoded by a DNA
CC   sequence (see AAV30581) in plasmid pETHisb. This vector was used to
CC   express soluble C fragment in Escherichia coli host cells, and the
CC   recombinant C fragment was purified on an affinity column. The invention
CC   relates to recombinant proteins derived from C. botulinum toxins. Methods
CC   are provided which allow for the isolation of soluble recombinant
CC   proteins free of significant endotoxin contamination. Preferred hosts for
CC   production of recombinant proteins are E. coli, insect cells and yeast
CC   cells. The recombinant toxins are used as immunogens for the production
CC   of vaccines and antitoxins that are useful in the treatment of humans and
CC   animals at risk of intoxication with clostridial toxin

PT Preparation of 1,3,6,8-tetrahydroxynaphthalene for use as a synthetic
PT material for melanine and as an intermediate for drugs and agricultural
PT chemicals, comprises using a microbe and an enzyme.
XX
PS Example 1; Page 9-10; 10pp; Japanese.
XX
CC The present invention describes a method for preparing 1,3,6,8-
CC tetrahydroxynaphthalene comprising using a microbe cell containing an
CC rppA gene encoding actinomycetes polyketide synthase, to convert malonyl
CC CoA as the substrate or a substance which can produce malonyl CoA in the
CC microbe cell to 1,3,6,8-tetrahydroxynaphthalene and recovering it.
CC 1,3,6,8-tetrahydroxynaphthalene is used as a synthetic material for
CC melanine and as an intermediate for drugs and agricultural chemicals. The
CC present sequence represents the actinomycetes polyketide synthase protein
CC isolated from Streptomyces griseus comprising an histidine tag, which is
CC used in an example from the present invention

PT New isolated RB47 and RB60 genes - used for, e.g. regulated expression of
PT desired recombinant molecule in prokaryote and eukaryote, particularly
PT plant cells.
XX

PS Claim 10; Fig 5; 109pp; English.
XX
CC The sequence is that of a histidine tagged RB47 mRNA binding protein. It
CC can be used in the regulated production of a desired recombinant
CC molecule. It can be used as a cell culture system, an in vitro expression
CC system or a whole tissue, preferably a plant and allows for a high level
CC of protein synthesis in plant chloroplasts and in the cytoplasm of both
CC prokaryotic and eukaryotic cells. It can also be used to screen for
CC agonists or antagonists of the binding of RB47 to the RB47 binding site.
CC Antagonists of the binding are useful in the prevention of plant
CC propagation. They can also be used for screening for agonists or
CC antagonists of RB60. Such agonists or antagonists would be useful in
CC general to modify expression of RB60 as a way to regulate cellular
CC processes in a redox manner

PT Delivering effector proteins into target cell for use in protein therapy,
PT involves introducing effector protein fused to protein transduction
PT domain of human immunodeficiency virus TAT protein, into target cells.
XX
PS Example 1; Page 20; 43pp; English.
XX
CC The present sequence represents a His tag and factor Xa protease cleavage
CC site, which is used in the method of the invention. The specification
CC describes a method for delivering effector proteins into a target cell.
CC The method comprises introducing an effector protein fused to a protein
CC transduction domain of a human immunodeficiency virus (HIV) tat protein
CC into the target cell. The method is used for delivering a heterologous
CC effector protein such as an effector protein produced by bacterial plant
CC pathogen, animal pathogen or a rhizosphere bacteria, or a protein
CC secreted and/or delivered into eukaryotic cells by a Type III secretion
CC system or a hypersensitive response elicitor, an avirulence protein, a
CC hypersensitive response and pathogenicity-dependent outer protein, a
CC virulence protein or a pathogenicity protein, into an eukaryotic cell.
CC The method is useful for delivering effector proteins for use in
CC pharmaceutical, insecticidal, fungicide, herbicide and other applications

CC -!- FUNCTION: BOTULINUS TOXIN ACTS BY INHIBITING NEUROTRANSMITTER
CC RELEASE. IT BINDS TO PERIPHERAL NEURONAL SYNAPSES, IS INTERNALIZED
CC AND MOVES BY RETROGRADE TRANSPORT UP THE AXON INTO THE SPINAL CORD
CC WHERE IT CAN MOVE BETWEEN POSTSYNAPTIC AND PRESYNAPTIC NEURONS. IT
CC INHIBITS NEUROTRANSMITTER RELEASE BY ACTING AS A ZINC
CC ENDOPEPTIDASE THAT CLEAVES THE 60-LYS-|-LEU-61 BOND OF
CC SYNAPTOBREVINS-1 AND -2.
CC -!- CATALYTIC ACTIVITY: Limited hydrolysis of proteins of the

```
CC       neuroexocytosis apparatus, synaptobrevins, SNAP25 or syntaxin. No
CC       detected action on small molecule substrates.
CC   -!- COFACTOR: Binds 1 zinc ion per subunit (By similarity).
CC   -!- SUBUNIT: Disulfide-linked heterodimer of a light chain (L) and a
CC       heavy chain (H). The light chain has the pharmacological activity,
CC       while the N- and C-terminal of the heavy chain mediate channel
CC       formation and toxin binding, respectively.
CC   -!- SUBCELLULAR LOCATION: Secreted.
CC   -!- MISCELLANEOUS: There are seven antigenically distinct forms of
CC       botulinum neurotoxin: Types A, B, C1, D, E, F, and G.
CC   -!- MISCELLANEOUS: BOTULINUM TYPE D NEUROTOXIN IS SYNTHESIZED BY D
CC       STRAIN OF CLOSTRIDIUM BOTULINUM WHICH CARRY THE APPROPRIATE
CC       BACTERIOPHAGE.
CC   -!- SIMILARITY: Belongs to peptidase family M27.

CC   -!- FUNCTION: Role in mesoderm induction and its earliest regional
CC       specification, somitogenesis, and myogenic and sclerotomal
CC       differentiation. May have a regulatory role when quiescent
CC       vascular smooth muscle cells reenter the cell cycle.
CC   -!- SUBCELLULAR LOCATION: Nuclear (Potential).
CC   -!- DEVELOPMENTAL STAGE: It is not expressed before 8-8.5 dpc. At 8-
CC       8.5 dpc it is found on the entire epithelium of the somite. At 9.5
CC       dpc its expression is restricted to the sclerotome. At 10.5 dpc it
CC       is found in sclerotomally derived cells including the vertebral
CC       and costal precursors.
CC   -!- SIMILARITY: Contains 1 homeobox domain.

CC   -!- FUNCTION: Probably play a role in the development of the brain and
CC       the sense organs. Can bind to the BCD target sequence (BTS): 5'-
CC       TCTAATCCC-3' (By similarity). May play a role in the specification
CC       or differentiation of neurons in the deep layers of the cerebral
CC       cortex, and also in cerebellar regionalization during early
CC       development.
CC   -!- SUBCELLULAR LOCATION: Nuclear (Probable).
CC   -!- TISSUE SPECIFICITY: Brain: restricted regions of the developing
CC       rostral brain including the presumptive cerebral cortex and
CC       olfactory bulbs; expressed in the developing olfactory, auricolar
CC       and ocular systems, including the covering of the optic nerve (By
CC       similarity).
CC   -!- DEVELOPMENTAL STAGE: Expressed throughout the forebrain and
CC       midbrain during development, and in addition is also seen in
CC       discrete spatial and temporal domains in the developing cerebral
CC       cortex and cerebellum. Confined to a subpopulation of neurons in
CC       layers 5 and 6 within the adult cerebral cortex and during
CC       development expression is high in the progenitors of these deep-
CC       layer cells. Expressed in the developing cerebellum in spatially
CC       restricted regions of the external granular layer.
CC   -!- SIMILARITY: Belongs to the paired homeobox family. Bicoid
CC       subfamily.
CC   -!- SIMILARITY: Contains 1 homeobox domain.

CC   -!- FUNCTION: BOTULINUS TOXIN ACTS BY INHIBITING NEUROTRANSMITTER
CC       RELEASE. IT BINDS TO PERIPHERAL NEURONAL SYNAPSES, IS INTERNALIZED
CC       AND MOVES BY RETROGRADE TRANSPORT UP THE AXON INTO THE SPINAL CORD
CC       WHERE IT CAN MOVE BETWEEN POSTSYNAPTIC AND PRESYNAPTIC NEURONS. IT
CC       INHIBITS NEUROTRANSMITTER RELEASE BY ACTING AS A ZINC
CC       ENDOPEPTIDASE THAT CLEAVES SYNTAXIN.
CC   -!- CATALYTIC ACTIVITY: Limited hydrolysis of proteins of the
CC       neuroexocytosis apparatus, synaptobrevins, SNAP25 or syntaxin. No
CC       detected action on small molecule substrates.
CC   -!- COFACTOR: Binds 1 zinc ion per subunit (By similarity).
CC   -!- SUBUNIT: Disulfide-linked heterodimer of a light chain (L) and a
CC       heavy chain (H). The light chain has the pharmacological activity,
CC       while the N- and C-terminal of the heavy chain mediate channel
CC       formation and toxin binding, respectively.
CC   -!- SUBCELLULAR LOCATION: Secreted.
CC   -!- MISCELLANEOUS: There are seven antigenically distinct forms of
CC       botulinum neurotoxin: Types A, B, C1, D, E, F, and G.
CC   -!- MISCELLANEOUS: BOTULINUM TYPE C1 NEUROTOXIN IS SYNTHESIZED BY C
CC       STRAIN OF CLOSTRIDIUM BOTULINUM WHICH CARRY THE APPROPRIATE
CC       BACTERIOPHAGE.
CC   -!- SIMILARITY: Belongs to peptidase family M27.

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

PT Host cell containing recombinant expression vector encoding Clostridium
PT botulinum type B or E toxin - useful to treat humans and other animals at
PT risk of intoxication with clostridial toxin.
XX
PS Example 47; Page 352-353; 428pp; English.
XX
CC This is the amino acid sequence of the histidine-tagged C fragment of
CC Clostridium botulinum seotype D neurotoxin, encoded by a DNA sequence
CC (see AAV30591) in plasmid pETHisb. This vector can be used to express
CC BotD soluble C fragment in Escherichia coli host cells, with the
CC recombinant C fragment being purified on an affinity column. The
CC invention relates to recombinant proteins derived from C. botulinum
CC toxins, especially type B and type E toxins. Methods are provided which

```
CC   allow for the isolation of soluble recombinant proteins free of
CC   significant endotoxin contamination. Preferred hosts are E. coli, insect
CC   cells and yeast cells. The recombinant toxins are used as immunogens for
CC   the production of vaccines and antitoxins useful in the treatment of
CC   humans and animals at risk of intoxication with clostridial toxin

PT   New nucleic acids encoding the carboxy- or amino-terminal portions of the
PT   heavy chain of botulinum neurotoxin of serotype A-G, useful as vaccine
PT   against botulism.
XX
PS   Claim 3; Fig 6b; 73pp; English.
XX
CC   Botulism neurotoxins are translated as a single 150 kDa polypeptide chain
CC   and then posttranslationally nicked, forming a dichain consisting of a
CC   100 kDa heavy chain and a 50 kDa light chain which remain linked by a
CC   disulfide bond. Nucleic acids encoding the carboxy-terminal (HC) or amino
CC   -terminal (HN) portion of the heavy chain of botulinum neurotoxin (BoNT)
CC   can be used in recombinant expression vectors and expressed in
CC   transformed cells to produce peptide antigens useful for eliciting an
CC   immune response to give protective immunity against botulinum neurotoxin,
CC   which causes botulism. The nucleic acids are expressible in a recombinant
CC   organisms such as Escherichia coli or Pichia pastoris. The use of
CC   recombinant nucleic acids are advantageous since it eliminates the need
CC   to culture large quantities of hazardous toxin-producing bacterium.
CC   Production yield from the genetically engineered product is also high and
CC   cost of production is lower. The nucleic acids can be derived from
CC   Clostridium botulinum serotypes A-G

PT   Host cell containing recombinant expression vector encoding Clostridium
PT   botulinum type B or E toxin - useful to treat humans and other animals at
PT   risk of intoxication with clostridial toxin.
XX
PS   Example 45; Page 339-341; 428pp; English.
XX
CC   This is the amino acid sequence of the histidine-tagged C fragment of
CC   Clostridium botulinum (Stockholm strain) type C1 neurotoxin, encoded by a
CC   DNA sequence (see AAV30588) in plasmid pETHisb. This vector is used to
CC   express BotC soluble C fragment in Escherichia coli host cells, and the
CC   recombinant C fragment was purified on an affinity column. The invention
CC   relates to recombinant proteins derived from C. botulinum toxins,
CC   especially type B and type E toxins. Methods are provided which allow for
CC   the isolation of soluble recombinant proteins free of significant
CC   endotoxin contamination. Preferred hosts for production of recombinant
CC   proteins are E. coli, insect cells and yeast cells. The recombinant
CC   toxins are used as immunogens for the production of vaccines and
CC   antitoxins that are useful in the treatment of humans and animals at risk
CC   of intoxication with clostridial toxin

PT   Novel Botulinum neurotoxin vaccine comprising a fragment from botulinum
PT   toxin serotypes A-G, is used for inducing an immune response against
PT   botulinum.
XX
PS   Claim 24; Page 41-42; 54pp; English.
XX
CC   The invention relates to novel vaccines that induce a protective immune
CC   response against botulinum neurotoxin (BoNT) serotypes A, B, C, D, E, F
CC   and G (BoNTA-BoNTG). The vaccine of the invention is novel recombinant
CC   DNA construct comprising a vector, and at least one nucleic acid fragment
CC   comprising a C-terminal heavy chain fragment (Hc) from BoNT serotypes A-
CC   G. In preferred embodiments of the invention, the vector is a Venezuelan
CC   equine encephalitis virus (VEE) replicon vector. Use of this vector
CC   results in the production of large amounts of a protein encoded by a
CC   sequence cloned into the replicon. The constructs are used to produce
CC   vaccines against botulism. The proteins can also be used as diagnostic
CC   tools for the diagnosis of botulism. The transformed host cells can be
CC   used to analyse the effectiveness of drugs and agents which inhibit toxin
CC   effects. The vaccine currently used against botulism is dangerous and
CC   expensive to produce, and contains formalin, which is very painful for
CC   the recipient. Also, the vaccine is incomplete, in that only 5 of the 7
```

CC serotypes are represented in the formulation. The novel vaccine of
CC overcomes these problems, as it is easily purified, and available in
CC large quantities. It is also expressed in the lymph nodes for a better
CC immune response. Sequences AAY77134-Y77139 represent synthetic BoNT Hc
CC fragments used in the present invention. The DNA encoding these sequences
CC had been optimised for codon usage for expression in yeast

PS   Example 1; Page 31-33; 37pp; English.
XX
CC   The present sequence represents a modified serotype C botulinum toxin,
CC   termed rBoNT/C, in which amino acids His-229, Glu-230 and His-233 of the
CC   native sequence are substituted by Gly, Thr and Asn, respectively, i.e.
CC   the zinc binding motif (see AAY05817) of the light chain holotoxin is
CC   modified, resulting in loss of endoprotease activity. DNA coding for the
CC   modified botulinum toxin (see AAX25521) was assembled from 3 separate
CC   toxin fragments using PCR and site-directed mutagenesis. The modified
CC   recombinant botulinum toxin maintains its ability to translocate from the
CC   gut into the general circulation but is non-toxic. It can be used as an
CC   oral vaccine for antigenic peptides including botulinum toxin (i.e. an
CC   oral vaccine for botulism) or for the oral delivery of other therapeutic
CC   agents to the general circulation

XX
CC   This is the amino acid sequence of the histidine-tagged C fragment of
CC   Clostridium botulinum (Danish strain) type B toxin, encoded by a DNA
CC   sequence (see AAV30581) in plasmid pETHisb. This vector was used to
CC   express soluble C fragment in Escherichia coli host cells, and the
CC   recombinant C fragment was purified on an affinity column. The invention
CC   relates to recombinant proteins derived from C. botulinum toxins. Methods
CC   are provided which allow for the isolation of soluble recombinant
CC   proteins free of significant endotoxin contamination. Preferred hosts for
CC   production of recombinant proteins are E. coli, insect cells and yeast
CC   cells. The recombinant toxins are used as immunogens for the production
CC   of vaccines and antitoxins that are useful in the treatment of humans and

XX
CC This is the amino acid sequence of a histidine-tagged fragment C
CC polypeptide of Clostridium botulinum serotype A toxin encoded by a DNA
CC sequence (see AAV30572) in plasmid pHisBot, and by a DNA sequence (see
CC AAV30575) in pHisBotA. These vectors were used to express native (i.e.
CC non-fusion) soluble C fragment in Escherichia coli host cells, with the
CC recombinant C fragment being purified on a poly-histidine binding
CC affinity resin. The invention relates to recombinant proteins derived
CC from C. botulinum toxins. Methods are provided which allow the isolation
CC of soluble recombinant proteins that are free of significant endotoxin
CC contamination. Preferred hosts for production of recombinant proteins are
CC E. coli, insect cells and yeast cells. The recombinant toxins are used as
CC immunogens for the production of vaccines and antitoxins that are useful
CC in the treatment of humans and animals at risk of intoxication with
CC clostridial toxin

PT   Host cell containing recombinant expression vector encoding Clostridium
PT   botulinum type B or E toxin - useful to treat humans and other animals at
PT   risk of intoxication with clostridial toxin.
XX
PS   Example 41; Page 324-325; 428pp; English.
XX
CC   This is the amino acid sequence of the histidine-tagged C fragment of
CC   Clostridium botulinum (Belgua strain) type E neurotoxin, encoded by a DNA
CC   sequence (see AAV30584) in plasmid pETHisb. This vector is used to
CC   express BotE soluble C fragment in Escherichia coli host cells, and the
CC   recombinant C fragment was purified on an affinity column. The invention
CC   relates to recombinant proteins derived from C. botulinum toxins,
CC   especially type B and type E toxins. Methods are provided which allow for
CC   the isolation of soluble recombinant proteins free of significant
CC   endotoxin contamination. Preferred hosts for production of recombinant
CC   proteins are E. coli, insect cells and yeast cells. The recombinant
CC   toxins are used as immunogens for the production of vaccines and
CC   antitoxins that are useful in the treatment of humans and animals at risk
CC   of intoxication with clostridial toxin

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

CC -!- FUNCTION: BOTULINUS TOXIN ACTS BY INHIBITING NEUROTRANSMITTER
CC RELEASE. IT BINDS TO PERIPHERAL NEURONAL SYNAPSES, IS INTERNALIZED
CC AND MOVES BY RETROGRADE TRANSPORT UP THE AXON INTO THE SPINAL CORD
CC WHERE IT CAN MOVE BETWEEN POSTSYNAPTIC AND PRESYNAPTIC NEURONS. IT
CC INHIBITS NEUROTRANSMITTER RELEASE BY ACTING AS A ZINC
CC ENDOPEPTIDASE THAT CLEAVES THE 60-LYS-|-LEU-61 BOND OF
CC SYNAPTOBREVINS-1 AND -2.
CC -!- CATALYTIC ACTIVITY: Limited hydrolysis of proteins of the

```
CC       neuroexocytosis apparatus, synaptobrevins, SNAP25 or syntaxin. No
CC       detected action on small molecule substrates.
CC   -!- COFACTOR: Binds 1 zinc ion per subunit (By similarity).
CC   -!- SUBUNIT: Disulfide-linked heterodimer of a light chain (L) and a
CC       heavy chain (H). The light chain has the pharmacological activity,
CC       while the N- and C-terminal of the heavy chain mediate channel
CC       formation and toxin binding, respectively.
CC   -!- SUBCELLULAR LOCATION: Secreted.
CC   -!- MISCELLANEOUS: There are seven antigenically distinct forms of
CC       botulinum neurotoxin: Types A, B, C1, D, E, F, and G.
CC   -!- MISCELLANEOUS: BOTULINUM TYPE D NEUROTOXIN IS SYNTHESIZED BY D
CC       STRAIN OF CLOSTRIDIUM BOTULINUM WHICH CARRY THE APPROPRIATE
CC       BACTERIOPHAGE.
CC   -!- SIMILARITY: Belongs to peptidase family M27.

CC       ENDOPEPTIDASE THAT CLEAVES THE 76-GLN-|-PHE-77 BOND OF
CC       SYNAPTOBREVIN-2.
CC   -!- CATALYTIC ACTIVITY: Limited hydrolysis of proteins of the
CC       neuroexocytosis apparatus, synaptobrevins, SNAP25 or syntaxin. No
CC       detected action on small molecule substrates.
CC   -!- COFACTOR: Binds 1 zinc ion per subunit (By similarity).
CC   -!- SUBUNIT: Disulfide-linked heterodimer of a light chain (L) and a
CC       heavy chain (H). The light chain has the pharmacological activity,
CC       while the N- and C-terminal of the heavy chain mediate channel
CC       formation and toxin binding, respectively.
CC   -!- SUBCELLULAR LOCATION: Secreted.
CC   -!- MISCELLANEOUS: There are seven antigenically distinct forms of
CC       botulinum neurotoxin: Types A, B, C1, D, E, F, and G.
CC   -!- SIMILARITY: Belongs to peptidase family M27.

CC   -!- FUNCTION: Inhibits acetylcholine release. The botulinum toxin
CC       binds with high affinity to peripheral neuronal presynaptic
CC       membrane, is then internalized by receptor-mediated endocytosis.
CC       The C-terminus of the heavy chain (H) is responsible for the
CC       adherence of the toxin to the cell surface while the N-terminus
CC       mediates transport of the light chain from the endocytic vesicle
CC       to the cytosol. After translocation, the light chain (L)
CC       hydrolyzes the 197-Gln-|-Arg-198 bond in SNAP-25, thereby blocking
CC       neurotransmitter release. Inhibition of acetylcholine release
CC       results in flaccid paralysis, with frequent heart or respiratory
CC       failure (By similarity).
CC   -!- CATALYTIC ACTIVITY: Limited hydrolysis of proteins of the
CC       neuroexocytosis apparatus, synaptobrevins, SNAP25 or syntaxin. No
CC       detected action on small molecule substrates.
CC   -!- SUBUNIT: Disulfide-linked heterodimer of a light chain (L) and a
CC       heavy chain (H) (By similarity).
CC   -!- SUBCELLULAR LOCATION: Secreted.
CC   -!- MISCELLANEOUS: There are seven antigenically distinct forms of
CC       botulinum neurotoxin: Types A, B, C1, D, E, F, and G.
CC   -!- SIMILARITY: Belongs to peptidase family M27.

CC   -!- FUNCTION: Inhibits acetylcholine release. The botulinum toxin
CC       binds with high affinity to peripheral neuronal presynaptic
CC       membrane, is then internalized by receptor-mediated endocytosis.
CC       The C-terminus of the heavy chain (H) is responsible for the
CC       adherence of the toxin to the cell surface while the N-terminus
CC       mediates transport of the light chain from the endocytic vesicle
CC       to the cytosol. After translocation, the light chain (L)
CC       hydrolyzes the 197-Gln-|-Arg-198 bond in SNAP-25, thereby blocking
CC       neurotransmitter release. Inhibition of acetylcholine release
CC       results in flaccid paralysis, with frequent heart or respiratory
CC       failure.
CC   -!- CATALYTIC ACTIVITY: Limited hydrolysis of proteins of the
CC       neuroexocytosis apparatus, synaptobrevins, SNAP25 or syntaxin. No
CC       detected action on small molecule substrates.
CC   -!- COFACTOR: Binds 1 zinc ion per subunit.
CC   -!- SUBUNIT: Disulfide-linked heterodimer of a light chain (L) and a
CC       heavy chain (H).
CC   -!- SUBCELLULAR LOCATION: Secreted.
CC   -!- PHARMACEUTICAL: Available under the name BOTOX (Allergan) for
CC       the treatment of strabismus and blepharospasm associated with
CC       dystonia and cervical dystonia. Also used for the treatment of
CC       hemifacial spasm and a number of other neurological disorders
CC       characterized by abnormal muscle contraction.
CC   -!- MISCELLANEOUS: There are seven antigenically distinct forms of
CC       botulinum neurotoxin: Types A, B, C1, D, E, F, and G.
CC   -!- SIMILARITY: Belongs to peptidase family M27.

CC   -!- FUNCTION: BOTULINUS TOXIN ACTS BY INHIBITING NEUROTRANSMITTER
CC       RELEASE. IT BINDS TO PERIPHERAL NEURONAL SYNAPSES, IS INTERNALIZED
CC       AND MOVES BY RETROGRADE TRANSPORT UP THE AXON INTO THE SPINAL CORD
CC       WHERE IT CAN MOVE BETWEEN POSTSYNAPTIC AND PRESYNAPTIC NEURONS. IT
CC       INHIBITS NEUROTRANSMITTER RELEASE BY ACTING AS A ZINC
CC       ENDOPEPTIDASE THAT CATALYZES THE HYDROLYSIS OF THE 58-GLN-|-LYS-59
CC       BOND OF SYNAPTOBREVINS-1 AND -2.
CC   -!- CATALYTIC ACTIVITY: Limited hydrolysis of proteins of the
CC       neuroexocytosis apparatus, synaptobrevins, SNAP25 or syntaxin. No
CC       detected action on small molecule substrates.
CC   -!- COFACTOR: Binds 1 zinc ion per subunit (By similarity).
CC   -!- SUBUNIT: Disulfide-linked heterodimer of a light chain (L) and a
CC       heavy chain (H). The light chain has the pharmacological activity,
CC       while the N- and C-terminal of the heavy chain mediate channel
CC       formation and toxin binding, respectively.
CC   -!- SUBCELLULAR LOCATION: Secreted.
CC   -!- MISCELLANEOUS: There are seven antigenically distinct forms of
CC       botulinum neurotoxin: Types A, B, C1, D, E, F, and G.
CC   -!- SIMILARITY: Belongs to peptidase family M27.

CC   -!- FUNCTION: BOTULINUS TOXIN ACTS BY INHIBITING NEUROTRANSMITTER
CC       RELEASE. IT BINDS TO PERIPHERAL NEURONAL SYNAPSES, IS INTERNALIZED
CC       AND MOVES BY RETROGRADE TRANSPORT UP THE AXON INTO THE SPINAL CORD
CC       WHERE IT CAN MOVE BETWEEN POSTSYNAPTIC AND PRESYNAPTIC NEURONS. IT
CC       INHIBITS NEUROTRANSMITTER RELEASE BY ACTING AS A ZINC
CC       ENDOPEPTIDASE.
CC   -!- CATALYTIC ACTIVITY: Limited hydrolysis of proteins of the
CC       neuroexocytosis apparatus, synaptobrevins, SNAP25 or syntaxin. No
CC       detected action on small molecule substrates.
CC   -!- COFACTOR: Binds 1 zinc ion per subunit (By similarity).
CC   -!- SUBUNIT: Disulfide-linked heterodimer of a light chain (L) and a
CC       heavy chain (H). The light chain has the pharmacological activity,
CC       while the N- and C-terminal of the heavy chain mediate channel
CC       formation and toxin binding, respectively.
CC   -!- SUBCELLULAR LOCATION: Secreted.
CC   -!- MISCELLANEOUS: There are seven antigenically distinct forms of
CC       botulinum neurotoxin: Types A, B, C1, D, E, F, and G.
CC   -!- SIMILARITY: Belongs to peptidase family M27.

CC   -!- FUNCTION: TETANUS TOXIN ACTS BY INHIBITING NEUROTRANSMITTER
CC       RELEASE. IT BINDS TO PERIPHERAL NEURONAL SYNAPSES, IS INTERNALIZED
CC       AND MOVES BY RETROGRADE TRANSPORT UP THE AXON INTO THE SPINAL CORD
CC       WHERE IT CAN MOVE BETWEEN POSTSYNAPTIC AND PRESYNAPTIC NEURONS. IT
CC       INHIBITS NEUROTRANSMITTER RELEASE BY ACTING AS A ZINC
CC       ENDOPEPTIDASE THAT CATALYZES THE HYDROLYSIS OF THE 76-GLN-|-PHE-77
CC       BOND OF SYNAPTOBREVIN-2.
CC   -!- CATALYTIC ACTIVITY: Hydrolysis of 76-Gln-|-Phe-77 bond in
CC       synaptobrevin 2.
CC   -!- COFACTOR: Binds 1 zinc ion per subunit (By similarity).
CC   -!- SUBUNIT: THE PRECURSOR POLYPEPTIDE IS SUBSEQUENTLY CLEAVED TO
CC       YIELD SUBCHAINS L AND H. THESE REMAIN LINKED BY A DISULFIDE BRIDGE
CC       AND ARE NON-TOXIC AFTER SEPARATION.
CC   -!- MISCELLANEOUS: THE C-TERMINAL OF THE HEAVY CHAIN BINDS TO
CC       GANGLIOSIDE RECEPTORS.
CC   -!- SIMILARITY: Belongs to peptidase family M27.

CC   -!- FUNCTION: DNA-dependent RNA polymerase catalyzes the transcription
CC       of DNA into RNA using the four ribonucleoside triphosphates as
CC       substrates.
CC   -!- CATALYTIC ACTIVITY: N nucleoside triphosphate = N diphosphate +
CC       {RNA}(N).
CC   -!- MISCELLANEOUS: THIS RNA POLYMERASE IS ENCODED ON A CIRCULAR DNA.
CC   -!- SIMILARITY: Belongs to the RNA polymerase beta chain family.

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

PT Host cell containing recombinant expression vector encoding Clostridium
PT botulinum type B or E toxin - useful to treat humans and other animals at
PT risk of intoxication with clostridial toxin.
XX
PS Example 48; Page 364-365; 428pp; English.
XX
CC This is the amino acid sequence of the histidine-tagged C fragment of
CC Clostridium botulinum (202F strain) type F neurotoxin, encoded by a DNA
CC sequence (see AAV30593) in plasmid pETHisb. This vector can be used to
CC express BotC soluble C fragment in Escherichia coli host cells, with the
CC recombinant C fragment being purified on an affinity column. The
CC invention relates to recombinant proteins derived from C. botulinum
CC toxins, especially type B and type E toxins. Methods are provided which

CC allow for the isolation of soluble recombinant proteins free of
CC significant endotoxin contamination. Preferred hosts for production of
CC recombinant proteins are E. coli, insect cells and yeast cells. The
CC recombinant toxins are used as immunogens for the production of vaccines
CC and antitoxins that are useful in the treatment of humans and animals at
CC risk of intoxication with clostridial toxin

XX
CC Novel polypeptides (AAW09014-17) respectively comprise amino acids 848-
CC 1278, 848-991, 992-1135 and 1136-1278 in the heavy chain of a type F
CC botulinum neurotoxin (BoNT/F). They lack the L chain and HN epitopes
CC necessary for metalloprotease activity and toxin internalisation. They
CC are free of botulinum toxin activity but can induce protective immunity
CC to a type F botulinum toxin, making them useful for vaccine prodn.
CC Recombinant polypeptides can be produced in transformed host cells, esp.
CC as fusion proteins, e.g. with maltose binding protein to facilitate
CC purification. (Updated on 17-OCT-2003 to standardise OS field)

PT Immunogenic type F botulinum toxin polypeptide(s) - allows recombinant
PT vaccine prodn.
XX
PS Claim 5; Page 16-17; 37pp; English.
XX
CC A polypeptide (AAW09014) comprises the heavy chain (amino acids 848-1278)
CC of a type F botulinum neurotoxin (BoNT/F), and can be produced using a
CC synthetic gene (AAT48101) based on the natural gene sequence (AAT48100)
CC for the heavy chain. The polypeptides and its fragments (see also
CC AAW09015-17) lack the light chain and HN epitopes necessary for
CC metalloprotease activity and toxin internalisation. They are free of
CC botulinum toxin activity but can induce protective immunity to a type F
CC botulinum toxin, making them useful for vaccine prodn. Recombinant
CC polypeptides can be produced in transformed host cells, esp. as fusion
CC proteins, e.g. with maltose binding protein to facilitate purification.

XX
PT Novel Botulinum neurotoxin vaccine comprising a fragment from botulinum
PT toxin serotypes A-G, is used for inducing an immune response against
PT botulinum.
XX
PS Claim 27; Page; 54pp; English.
XX
CC The invention relates to novel vaccines that induce a protective immune
CC response against botulinum neurotoxin (BoNT) serotypes A, B, C, D, E, F
CC and G (BoNTA-BoNTG). The vaccine of the invention is novel recombinant
CC DNA construct comprising a vector, and at least one nucleic acid fragment
CC comprising a C-terminal heavy chain fragment (Hc) from BoNT serotypes A-
CC G. In preferred embodiments of the invention, the vector is a Venezuelan
CC equine encephalitis virus (VEE) replicon vector. Use of this vector
CC results in the production of large amounts of a protein encoded by a
CC sequence cloned into the replicon. The constructs are used to produce
CC vaccines against botulism. The proteins can also be used as diagnostic
CC tools for the diagnosis of botulism. The transformed host cells can be
CC used to analyse the effectiveness of drugs and agents which inhibit toxin
CC effects. The vaccine currently used against botulism is dangerous and
CC expensive to produce, and contains formalin, which is very painful for
CC the recipient. Also, the vaccine is incomplete, in that only 5 of the 7
CC serotypes are represented in the formulation. The novel vaccine of
CC overcomes these problems, as it is easily purified, and available in
CC large quantities. It is also expressed in the lymph nodes for a better
CC immune response. Sequences AAY77134-Y77139 represent synthetic BoNT Hc
CC fragments used in the present invention. The DNA encoding these sequences
CC had been optimised for codon usage for expression in yeast. Note: This
CC sequence is not given in the specification, but is decoded from the BoNTF
CC Hc DNA sequence given on pages 45-46

PT New nucleic acids encoding the carboxy- or amino-terminal portions of the
PT heavy chain of botulinum neurotoxin of serotype A-G, useful as vaccine
PT against botulism.
XX
PS Disclosure; Fig 18b; 73pp; English.
XX
CC Botulism neurotoxins are translated as a single 150 kDa polypeptide chain
CC and then posttranslationally nicked, forming a dichain consisting of a
CC 100 kDa heavy chain and a 50 kDa light chain which remain linked by a
CC disulfide bond. Nucleic acids encoding the carboxy-terminal (HC) or amino
CC -terminal (HN) portion of the heavy chain of botulinum neurotoxin (BoNT)
CC can be used in recombinant expression vectors and expressed in
CC transformed cells to produce peptide antigens useful for eliciting an
CC immune response to give protective immunity against botulinum neurotoxin,
CC which causes botulism. The nucleic acids are expressible in a recombinant
CC organisms such as Escherichia coli or Pichia pastoris. The use of
CC recombinant nucleic acids are advantageous since it eliminates the need
CC to culture large quantities of hazardous toxin-producing bacterium.
CC Production yield from the genetically engineered product is also high and
CC cost of production is lower. The nucleic acids can be derived from
CC Clostridium botulinum serotypes A-G

PT   New nucleic acids encoding the carboxy- or amino-terminal portions of the
PT   heavy chain of botulinum neurotoxin of serotype A-G, useful as vaccine
PT   against botulism.
XX
PS   Claim 3; Fig 9b; 73pp; English.
XX
CC   Botulism neurotoxins are translated as a single 150 kDa polypeptide chain
CC   and then posttranslationally nicked, forming a dichain consisting of a
CC   100 kDa heavy chain and a 50 kDa light chain which remain linked by a
CC   disulfide bond. Nucleic acids encoding the carboxy-terminal (HC) or amino
CC   -terminal (HN) portion of the heavy chain of botulinum neurotoxin (BoNT)
CC   can be used in recombinant expression vectors and expressed in
CC   transformed cells to produce peptide antigens useful for eliciting an
CC   immune response to give protective immunity against botulinum neurotoxin,
CC   which causes botulism. The nucleic acids are expressible in a recombinant
CC   organisms such as Escherichia coli or Pichia pastoris. The use of
CC   recombinant nucleic acids are advantageous since it eliminates the need
CC   to culture large quantities of hazardous toxin-producing bacterium.
CC   Production yield from the genetically engineered product is also high and
CC   cost of production is lower. The nucleic acids can be derived from
CC   Clostridium botulinum serotypes A-G

PT   New non toxic polypeptide for delivery of a therapeutic agent for the
PT   treatment of a CNS disorder comprising a binding domain that translocates
PT   the therapeutic agent into the neuronal cells.
XX
PS   Example 2; Page 44; 50pp; English.
XX
CC   The invention relates to a non toxic polypeptide, for delivery of a
CC   therapeutic agent to a neuronal cell, which comprises a binding domain
CC   (carboxy terminal half of heavy chain (HC) of a neurotoxin, designated as
CC   Hc) that binds to the neuronal cell and a translocation domain (amino
CC   terminal half of HC, designated as HN), that translocates the therapeutic
CC   agent into the neuronal cell, where the translocation domain is not a HN
CC   domain of a clostridial neurotoxin and is not a fragment or derivative of
CC   a HN domain of a clostridial toxin. Polypeptides of the invention are
CC   useful for the treatment of a disease state associated with neuronal
CC   cells. The polypeptide constructs are useful for delivering therapeutic
CC   substances to neuronal cells. They are useful to treat disorders of the
CC   CNS including neurodegenerative diseases, stroke, epilepsy, brain tumours
CC   and infection. They are also useful in gene therapy. The present sequence
CC   is modified clostridial heavy chain fragment. This sequence is
CC   constructed by fusing the binding domain of botulinum neurotoxin type F
CC   (BoNT/F) with translocation domain of diphtheria neurotoxin. (Updated on
CC   11-SEP-2003 to standardise OS field)

PT Conjugate for modulating cell survival and cell growth, modulating
PT release of inflammatory mediator from cells, comprises injected bacterial
PT effector protein and a carrier that targets the protein to target cell.
XX
PS Example 12; Page 57-60; 130pp; English.
XX
CC The invention relates to a conjugate comprising an injected bacterial
CC effector protein and a carrier that targets the effector protein to a
CC target cell. Pharmaceutical composition of the invention is useful for a
CC treatment selected from promoting or inhibiting survival of cells;
CC preventing and reversing damage to cells; killing cells; promoting or
CC inhibiting the growth of cells, apoptosis, release of an inflammatory
CC mediator from cells, division of cells and treating intracellular
CC infection and regulating nitric oxide release from cells. The invention
CC is useful in the manufacture of a medicament for treating a neuronal
CC cell, for intracellular infection, for interfering with intracellular
CC trafficking, for modulating expression of cell-surface markers and for
CC inhibiting secretion from cells. The invention is also useful for
CC treating Prion disease, Alzheimer' disease and wide range of disorders
CC including muscle spasms such as blephorospasm, torticolis and
CC hypersecretion disorders such as chronic obstructive pulmonary disease
CC (COPD), bronchitis and asthma. The present sequence is a fusion construct
CC comprising Corynebacterium diphtheriae diphtheria toxin translocation
CC domain (Dip-HN domain) and botulinum type F neurotoxin from Clostridium
CC botulinum. This sequence is used in the exemplification of the invention.

PT New non toxic polypeptide for delivery of a therapeutic agent for the
PT treatment of a CNS disorder comprising a binding domain that translocates
PT the therapeutic agent into the neuronal cells.
XX
PS Example 9; Page 42; 50pp; English.
XX
CC The invention relates to a non toxic polypeptide, for delivery of a
CC therapeutic agent to a neuronal cell, which comprises a binding domain
CC (carboxy terminal half of heavy chain (HC) of a neurotoxin, designated as
CC Hc) that binds to the neuronal cell and a translocation domain (amino
CC terminal half of HC, designated as HN), that translocates the therapeutic
CC agent into the neuronal cell, where the translocation domain is not a HN
CC domain of a clostridial neurotoxin and is not a fragment or derivative of
CC a HN domain of a clostridial toxin. Polypeptides of the invention are
CC useful for the treatment of a disease state associated with neuronal
CC cells. The polypeptide constructs are useful for delivering therapeutic
CC substances to neuronal cells. They are useful to treat disorders of the
CC CNS including neurodegenerative diseases, stroke, epilepsy, brain tumours
CC and infection. They are also useful in gene therapy. The present sequence
CC is modified clostridial heavy chain-superoxide dismutase conjugate. This
CC conjugate comprises a mitochondrial leader sequence from human Mn-
CC superoxide dismutase (MnSOD), MnSOD from Bacillus stearothermophilus,
CC linker that can be cleaved by thrombin, translocation domain from
CC diphtheria neurotoxin and a neuronal cell-specific binding domain from
CC botulinum neurotoxin type F (BoNT/F)

XX
PT Conjugate for modulating cell survival and cell growth, modulating
PT release of inflammatory mediator from cells, comprises injected bacterial
PT effector protein and a carrier that targets the protein to target cell.
XX
PS Example 12; Page 110-114; 130pp; English.
XX
CC The invention relates to a conjugate comprising an injected bacterial
CC effector protein and a carrier that targets the effector protein to a
CC target cell. Pharmaceutical composition of the invention is useful for a
CC treatment selected from promoting or inhibiting survival of cells;
CC preventing and reversing damage to cells; killing cells; promoting or
CC inhibiting the growth of cells, apoptosis, release of an inflammatory
CC mediator from cells, division of cells and treating intracellular
CC infection and regulating nitric oxide release from cells. The invention
CC is useful in the manufacture of a medicament for treating a neuronal
CC cell, for intracellular infection, for interfering with intracellular
CC trafficking, for modulating expression of cell-surface markers and for
CC inhibiting secretion from cells. The invention is also useful for
CC treating Prion disease, Alzheimer' disease and wide range of disorders
CC including muscle spasms such as blephorospasm, torticolis and
CC hypersecretion disorders such as chronic obstructive pulmonary disease
CC (COPD), bronchitis and asthma. The present sequence is a fusion construct
CC comprising Corynebacterium diphtheriae diphtheria toxin translocation
CC domain (DipT-HN domain), botulinum type F neurotoxin binding domain
CC (BoNT/F-Hc) from Clostridium botulinum and factor Xa linker peptide and
CC Yersinia pestis targetted effector protien YopT. This sequence is used in
CC the exemplification of the invention

CC -!- FUNCTION: BOTULINUS TOXIN ACTS BY INHIBITING NEUROTRANSMITTER
CC RELEASE. IT BINDS TO PERIPHERAL NEURONAL SYNAPSES, IS INTERNALIZED
CC AND MOVES BY RETROGRADE TRANSPORT UP THE AXON INTO THE SPINAL CORD
CC WHERE IT CAN MOVE BETWEEN POSTSYNAPTIC AND PRESYNAPTIC NEURONS. IT
CC INHIBITS NEUROTRANSMITTER RELEASE BY ACTING AS A ZINC
CC ENDOPEPTIDASE THAT CATALYZES THE HYDROLYSIS OF THE 58-GLN-|-LYS-59
CC BOND OF SYNAPTOBREVINS-1 AND -2.
CC -!- CATALYTIC ACTIVITY: Limited hydrolysis of proteins of the
CC neuroexocytosis apparatus, synaptobrevins, SNAP25 or syntaxin. No

```
CC       detected action on small molecule substrates.
CC   -!- COFACTOR: Binds 1 zinc ion per subunit (By similarity).
CC   -!- SUBUNIT: Disulfide-linked heterodimer of a light chain (L) and a
CC       heavy chain (H). The light chain has the pharmacological activity,
CC       while the N- and C-terminal of the heavy chain mediate channel
CC       formation and toxin binding, respectively.
CC   -!- SUBCELLULAR LOCATION: Secreted.
CC   -!- MISCELLANEOUS: There are seven antigenically distinct forms of
CC       botulinum neurotoxin: Types A, B, C1, D, E, F, and G.
CC   -!- SIMILARITY: Belongs to peptidase family M27.

CC   -!- FUNCTION: BOTULINUS TOXIN ACTS BY INHIBITING NEUROTRANSMITTER
CC       RELEASE. IT BINDS TO PERIPHERAL NEURONAL SYNAPSES, IS INTERNALIZED
CC       AND MOVES BY RETROGRADE TRANSPORT UP THE AXON INTO THE SPINAL CORD
CC       WHERE IT CAN MOVE BETWEEN POSTSYNAPTIC AND PRESYNAPTIC NEURONS. IT
CC       INHIBITS NEUROTRANSMITTER RELEASE BY ACTING AS A ZINC
CC       ENDOPEPTIDASE.
CC   -!- CATALYTIC ACTIVITY: Limited hydrolysis of proteins of the
CC       neuroexocytosis apparatus, synaptobrevins, SNAP25 or syntaxin. No
CC       detected action on small molecule substrates.
CC   -!- COFACTOR: Binds 1 zinc ion per subunit (By similarity).
CC   -!- SUBUNIT: Disulfide-linked heterodimer of a light chain (L) and a
CC       heavy chain (H). The light chain has the pharmacological activity,
CC       while the N- and C-terminal of the heavy chain mediate channel
CC       formation and toxin binding, respectively.
CC   -!- SUBCELLULAR LOCATION: Secreted.
CC   -!- MISCELLANEOUS: There are seven antigenically distinct forms of
CC       botulinum neurotoxin: Types A, B, C1, D, E, F, and G.
CC   -!- SIMILARITY: Belongs to peptidase family M27.

CC   -!- FUNCTION: Probably play a role in the development of the brain and
CC       the sense organs. Can bind to the BCD target sequence (BTS): 5'-
CC       TCTAATCCC-3' (By similarity). May play a role in the specification
CC       or differentiation of neurons in the deep layers of the cerebral
CC       cortex, and also in cerebellar regionalization during early
CC       development.
CC   -!- SUBCELLULAR LOCATION: Nuclear (Probable).
CC   -!- TISSUE SPECIFICITY: Brain: restricted regions of the developing
CC       rostral brain including the presumptive cerebral cortex and
CC       olfactory bulbs; expressed in the developing olfactory, auricolar
CC       and ocular systems, including the covering of the optic nerve (By
CC       similarity).
CC   -!- DEVELOPMENTAL STAGE: Expressed throughout the forebrain and
CC       midbrain during development, and in addition is also seen in
CC       discrete spatial and temporal domains in the developing cerebral
CC       cortex and cerebellum. Confined to a subpopulation of neurons in
CC       layers 5 and 6 within the adult cerebral cortex and during
CC       development expression is high in the progenitors of these deep-
CC       layer cells. Expressed in the developing cerebellum in spatially
CC       restricted regions of the external granular layer.
CC   -!- SIMILARITY: Belongs to the paired homeobox family. Bicoid
CC       subfamily.
CC   -!- SIMILARITY: Contains 1 homeobox domain.

CC   -!- FUNCTION: MULTIFUNCTIONAL TRANSCRIPTION FACTOR THAT EXHIBITS
CC       POSITIVE AND NEGATIVE CONTROL ON A LARGE NUMBER OF CELLULAR AND
CC       VIRAL GENES BY BINDING TO SITES OVERLAPPING THE TRANSCRIPTION
CC       START SITE. MAY PLAY AN IMPORTANT ROLE IN DEVELOPMENT AND
CC       DIFFERENTIATION. THE FUNCTION OF YY1 AS AN ACTIVATOR OR A
CC       REPRESSOR IS SPECIFIED BY THE PRESENCE OF OTHER PROTEINS. FOR
CC       EXAMPLE IT ACTS AS A REPRESSOR IN ABSENCE OF ADENOVIRUS E1A
CC       PROTEIN BUT AS AN ACTIVATOR IN ITS PRESENCE.
CC   -!- SUBUNIT: Interacts with YAF2 through the region encompassing the
CC       first and second zinc fingers.
CC   -!- SUBCELLULAR LOCATION: Nuclear. Associated with the nuclear matrix.
CC   -!- SIMILARITY: BELONGS TO THE KRUEPPEL FAMILY OF C2H2-TYPE ZINC-
CC       FINGER PROTEINS.
CC   -!- SIMILARITY: Contains 3 C2H2-type zinc fingers.

RT   "The mouse zic gene family. Homologues of the Drosophila pair-rule
RT   gene odd-paired.";
RL   J. Biol. Chem. 271:1043-1047(1996).
CC   -!- FUNCTION: Probably functions as a transcription factor in the
CC       earliest stages of the left-right (LR) body axis formation (By
CC       similarity).
CC   -!- SUBCELLULAR LOCATION: Nuclear.
CC   -!- TISSUE SPECIFICITY: CNS. A high level expression is seen in the
CC       cerebellum.
```

```
CC   -!- SIMILARITY: BELONGS TO THE GLI FAMILY OF C2H2-TYPE ZINC-FINGER
CC       PROTEINS.
CC   -!- SIMILARITY: Contains 4 C2H2-type zinc fingers.

XX
CC This is the amino acid sequence of the histidine-tagged C fragment of
CC Clostridium botulinum (202F strain) type F neurotoxin, encoded by a DNA
CC sequence (see AAV30593) in plasmid pETHisb. This vector can be used to
CC express BotC soluble C fragment in Escherichia coli host cells, with the
CC recombinant C fragment being purified on an affinity column. The
CC invention relates to recombinant proteins derived from C. botulinum
CC toxins, especially type B and type E toxins. Methods are provided which

```
CC   allow for the isolation of soluble recombinant proteins free of
CC   significant endotoxin contamination. Preferred hosts for production of
CC   recombinant proteins are E. coli, insect cells and yeast cells. The
CC   recombinant toxins are used as immunogens for the production of vaccines
CC   and antitoxins that are useful in the treatment of humans and animals at
CC   risk of intoxication with clostridial toxin

PT   New non toxic polypeptide for delivery of a therapeutic agent for the
PT   treatment of a CNS disorder comprising a binding domain that translocates
PT   the therapeutic agent into the neuronal cells.
XX
PS   Example 9; Page 40; 50pp; English.
XX
CC   The invention relates to a non toxic polypeptide, for delivery of a
CC   therapeutic agent to a neuronal cell, which comprises a binding domain
CC   (carboxy terminal half of heavy chain (HC) of a neurotoxin, designated as
CC   Hc) that binds to the neuronal cell and a translocation domain (amino
CC   terminal half of HC, designated as HN), that translocates the therapeutic
CC   agent into the neuronal cell, where the translocation domain is not a HN
CC   domain of a clostridial neurotoxin and is not a fragment or derivative of
CC   a HN domain of a clostridial toxin. Polypeptides of the invention are
CC   useful for the treatment of a disease state associated with neuronal
CC   cells. The polypeptide constructs are useful for delivering therapeutic
CC   substances to neuronal cells. They are useful to treat disorders of the
CC   CNS including neurodegenerative diseases, stroke, epilepsy, brain tumours
CC   and infection. They are also useful in gene therapy. The present sequence
CC   is modified clostridial heavy chain-superoxide dismutase conjugate. This
CC   conjugate comprises bacterial Mn-superoxide dismutase (MnSOD), from
CC   Bacillus stearothermophilus, linker that can be cleaved by factor Xa,
CC   translocation domain from diphtheria neurotoxin and a neuronal cell-
CC   specific binding domain from botulinum neurotoxin type F (BoNT/F)

PT   Conjugate for modulating cell survival and cell growth, modulating
PT   release of inflammatory mediator from cells, comprises injected bacterial
PT   effector protein and a carrier that targets the protein to target cell.
XX
PS   Example 12; Page 110-114; 130pp; English.
XX
CC   The invention relates to a conjugate comprising an injected bacterial
```

CC effector protein and a carrier that targets the effector protein to a
CC target cell. Pharmaceutical composition of the invention is useful for a
CC treatment selected from promoting or inhibiting survival of cells;
CC preventing and reversing damage to cells; killing cells; promoting or
CC inhibiting the growth of cells, apoptosis, release of an inflammatory
CC mediator from cells, division of cells and treating intracellular
CC infection and regulating nitric oxide release from cells. The invention
CC is useful in the manufacture of a medicament for treating a neuronal
CC cell, for intracellular infection, for interfering with intracellular
CC trafficking, for modulating expression of cell-surface markers and for
CC inhibiting secretion from cells. The invention is also useful for
CC treating Prion disease, Alzheimer' disease and wide range of disorders
CC including muscle spasms such as blephorospasm, torticolis and
CC hypersecretion disorders such as chronic obstructive pulmonary disease
CC (COPD), bronchitis and asthma. The present sequence is a fusion construct
CC comprising Corynebacterium diphtheriae diphtheria toxin translocation
CC domain (DipT-HN domain), botulinum type F neurotoxin binding domain
CC (BoNT/F-Hc) from Clostridium botulinum and factor Xa linker peptide and
CC Yersinia pestis targetted effector protien YopT. This sequence is used in
CC the exemplification of the invention

PT Conjugate for modulating cell survival and cell growth, modulating
PT release of inflammatory mediator from cells, comprises injected bacterial
PT effector protein and a carrier that targets the protein to target cell.
XX
PS Example 12; Page 101-106; 130pp; English.
XX
CC The invention relates to a conjugate comprising an injected bacterial
CC effector protein and a carrier that targets the effector protein to a
CC target cell. Pharmaceutical composition of the invention is useful for a
CC treatment selected from promoting or inhibiting survival of cells;
CC preventing and reversing damage to cells; killing cells; promoting or
CC inhibiting the growth of cells, apoptosis, release of an inflammatory
CC mediator from cells, division of cells and treating intracellular
CC infection and regulating nitric oxide release from cells. The invention
CC is useful in the manufacture of a medicament for treating a neuronal
CC cell, for intracellular infection, for interfering with intracellular
CC trafficking, for modulating expression of cell-surface markers and for
CC inhibiting secretion from cells. The invention is also useful for
CC treating Prion disease, Alzheimer' disease and wide range of disorders
CC including muscle spasms such as blephorospasm, torticolis and
CC hypersecretion disorders such as chronic obstructive pulmonary disease
CC (COPD), bronchitis and asthma. The present sequence is a fusion construct
CC comprising Corynebacterium diphtheriae diphtheria toxin translocation
CC domain (DipT-HN domain), botulinum type F neurotoxin binding domain
CC (BoNT/F-Hc) from Clostridium botulinum and factor Xa linker peptide and
CC Salmonella typhimurium invasion gene D protein, SigD. This sequence is
CC used in the exemplification of the invention

PT Immunogenic type F botulinum toxin polypeptide(s) - allows recombinant
PT vaccine prodn.
XX
PS Claim 5; Page 16-17; 37pp; English.
XX
CC A polypeptide (AAW09014) comprises the heavy chain (amino acids 848-1278)
CC of a type F botulinum neurotoxin (BoNT/F), and can be produced using a
CC synthetic gene (AAT48101) based on the natural gene sequence (AAT48100)
CC for the heavy chain. The polypeptides and its fragments (see also
CC AAW09015-17) lack the light chain and HN epitopes necessary for
CC metalloprotease activity and toxin internalisation. They are free of
CC botulinum toxin activity but can induce protective immunity to a type F
CC botulinum toxin, making them useful for vaccine prodn. Recombinant
CC polypeptides can be produced in transformed host cells, esp. as fusion
CC proteins, e.g. with maltose binding protein to facilitate purification.
CC (Updated on 17-OCT-2003 to standardise OS field)

PT New nucleic acids encoding the carboxy- or amino-terminal portions of the
PT heavy chain of botulinum neurotoxin of serotype A-G, useful as vaccine
PT against botulism.
XX
PS Disclosure; Fig 18b; 73pp; English.
XX
CC Botulism neurotoxins are translated as a single 150 kDa polypeptide chain
CC and then posttranslationally nicked, forming a dichain consisting of a
CC 100 kDa heavy chain and a 50 kDa light chain which remain linked by a
CC disulfide bond. Nucleic acids encoding the carboxy-terminal (HC) or amino
CC -terminal (HN) portion of the heavy chain of botulinum neurotoxin (BoNT)
CC can be used in recombinant expression vectors and expressed in
CC transformed cells to produce peptide antigens useful for eliciting an
CC immune response to give protective immunity against botulinum neurotoxin,
CC which causes botulism. The nucleic acids are expressible in a recombinant
CC organisms such as Escherichia coli or Pichia pastoris. The use of
CC recombinant nucleic acids are advantageous since it eliminates the need
CC to culture large quantities of hazardous toxin-producing bacterium.
CC Production yield from the genetically engineered product is also high and
CC cost of production is lower. The nucleic acids can be derived from
CC Clostridium botulinum serotypes A-G

PT   New nucleic acids encoding the carboxy- or amino-terminal portions of the
PT   heavy chain of botulinum neurotoxin of serotype A-G, useful as vaccine
PT   against botulism.
XX
PS   Claim 3; Fig 9b; 73pp; English.
XX
CC   Botulism neurotoxins are translated as a single 150 kDa polypeptide chain
CC   and then posttranslationally nicked, forming a dichain consisting of a
CC   100 kDa heavy chain and a 50 kDa light chain which remain linked by a
CC   disulfide bond. Nucleic acids encoding the carboxy-terminal (HC) or amino
CC   -terminal (HN) portion of the heavy chain of botulinum neurotoxin (BoNT)
CC   can be used in recombinant expression vectors and expressed in
CC   transformed cells to produce peptide antigens useful for eliciting an
CC   immune response to give protective immunity against botulinum neurotoxin,
CC   which causes botulism. The nucleic acids are expressible in a recombinant
CC   organisms such as Escherichia coli or Pichia pastoris. The use of
CC   recombinant nucleic acids are advantageous since it eliminates the need
CC   to culture large quantities of hazardous toxin-producing bacterium.
CC   Production yield from the genetically engineered product is also high and
CC   cost of production is lower. The nucleic acids can be derived from
CC   Clostridium botulinum serotypes A-G

PT New non toxic polypeptide for delivery of a therapeutic agent for the
PT treatment of a CNS disorder comprising a binding domain that translocates
PT the therapeutic agent into the neuronal cells.
XX
PS Example 2; Page 44; 50pp; English.
XX
CC The invention relates to a non toxic polypeptide, for delivery of a
CC therapeutic agent to a neuronal cell, which comprises a binding domain
CC (carboxy terminal half of heavy chain (HC) of a neurotoxin, designated as
CC Hc) that binds to the neuronal cell and a translocation domain (amino
CC terminal half of HC, designated as HN), that translocates the therapeutic
CC agent into the neuronal cell, where the translocation domain is not a HN
CC domain of a clostridial neurotoxin and is not a fragment or derivative of
CC a HN domain of a clostridial toxin. Polypeptides of the invention are
CC useful for the treatment of a disease state associated with neuronal
CC cells. The polypeptide constructs are useful for delivering therapeutic
CC substances to neuronal cells. They are useful to treat disorders of the
CC CNS including neurodegenerative diseases, stroke, epilepsy, brain tumours
CC and infection. They are also useful in gene therapy. The present sequence
CC is modified clostridial heavy chain fragment. This sequence is
CC constructed by fusing the binding domain of botulinum neurotoxin type F
CC (BoNT/F) with translocation domain of diphtheria neurotoxin. (Updated on
CC 11-SEP-2003 to standardise OS field)

PT Conjugate for modulating cell survival and cell growth, modulating
PT release of inflammatory mediator from cells, comprises injected bacterial
PT effector protein and a carrier that targets the protein to target cell.
XX
PS Example 12; Page 57-60; 130pp; English.
XX
CC The invention relates to a conjugate comprising an injected bacterial
CC effector protein and a carrier that targets the effector protein to a
CC target cell. Pharmaceutical composition of the invention is useful for a
CC treatment selected from promoting or inhibiting survival of cells;
CC preventing and reversing damage to cells; killing cells; promoting or
CC inhibiting the growth of cells, apoptosis, release of an inflammatory
CC mediator from cells, division of cells and treating intracellular
CC infection and regulating nitric oxide release from cells. The invention
CC is useful in the manufacture of a medicament for treating a neuronal
CC cell, for intracellular infection, for interfering with intracellular
CC trafficking, for modulating expression of cell-surface markers and for
CC inhibiting secretion from cells. The invention is also useful for
CC treating Prion disease, Alzheimer' disease and wide range of disorders
CC including muscle spasms such as blephorospasm, torticolis and
CC hypersecretion disorders such as chronic obstructive pulmonary disease
CC (COPD), bronchitis and asthma. The present sequence is a fusion construct
CC comprising Corynebacterium diphtheriae diphtheria toxin translocation
CC domain (Dip-HN domain) and botulinum type F neurotoxin from Clostridium
CC botulinum. This sequence is used in the exemplification of the invention.
CC (Updated on 23-OCT-2003 to standardise OS field)

CC treatment selected from promoting or inhibiting survival of cells;
CC preventing and reversing damage to cells; killing cells; promoting or
CC inhibiting the growth of cells, apoptosis, release of an inflammatory
CC mediator from cells, division of cells and treating intracellular
CC infection and regulating nitric oxide release from cells. The invention
CC is useful in the manufacture of a medicament for treating a neuronal
CC cell, for intracellular infection, for interfering with intracellular
CC trafficking, for modulating expression of cell-surface markers and for
CC inhibiting secretion from cells. The invention is also useful for
CC treating Prion disease, Alzheimer' disease and wide range of disorders
CC including muscle spasms such as blephorospasm, torticolis and
CC hypersecretion disorders such as chronic obstructive pulmonary disease
CC (COPD), bronchitis and asthma. The present sequence is a fusion construct
CC comprising Corynebacterium diphtheriae diphtheria toxin translocation
CC domain (DipT-HN domain), botulinum type F neurotoxin binding domain
CC (BoNT/F-Hc) from Clostridium botulinum and factor Xa linker peptide. This
CC sequence is used in the exemplification of the invention

PT New non toxic polypeptide for delivery of a therapeutic agent for the
PT treatment of a CNS disorder comprising a binding domain that translocates
PT the therapeutic agent into the neuronal cells.
XX
PS Example 9; Page 43; 50pp; English.
XX
CC The invention relates to a non toxic polypeptide, for delivery of a
CC therapeutic agent to a neuronal cell, which comprises a binding domain
CC (carboxy terminal half of heavy chain (HC) of a neurotoxin, designated as
CC Hc) that binds to the neuronal cell and a translocation domain (amino
CC terminal half of HC, designated as HN), that translocates the therapeutic
CC agent into the neuronal cell, where the translocation domain is not a HN
CC domain of a clostridial neurotoxin and is not a fragment or derivative of
CC a HN domain of a clostridial toxin. Polypeptides of the invention are
CC useful for the treatment of a disease state associated with neuronal
CC cells. The polypeptide constructs are useful for delivering therapeutic
CC substances to neuronal cells. They are useful to treat disorders of the
CC CNS including neurodegenerative diseases, stroke, epilepsy, brain tumours
CC and infection. They are also useful in gene therapy. The present sequence
CC is modified clostridial heavy chain-superoxide dismutase conjugate. This
CC conjugate comprises bacterial Mn-superoxide dismutase (MnSOD), from
CC Bacillus stearothermophilus, linker that can be cleaved by factor Xa,
CC translocation peptide from influenza virus and a neuronal cell-specific
CC binding domain from botulinum neurotoxin type F (BoNT/F)

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

CC   -!- FUNCTION: BOTULINUS TOXIN ACTS BY INHIBITING NEUROTRANSMITTER
CC       RELEASE. IT BINDS TO PERIPHERAL NEURONAL SYNAPSES, IS INTERNALIZED
CC       AND MOVES BY RETROGRADE TRANSPORT UP THE AXON INTO THE SPINAL CORD
CC       WHERE IT CAN MOVE BETWEEN POSTSYNAPTIC AND PRESYNAPTIC NEURONS. IT
CC       INHIBITS NEUROTRANSMITTER RELEASE BY ACTING AS A ZINC
CC       ENDOPEPTIDASE THAT CATALYZES THE HYDROLYSIS OF THE 58-GLN-|-LYS-59
CC       BOND OF SYNAPTOBREVINS-1 AND -2.
CC   -!- CATALYTIC ACTIVITY: Limited hydrolysis of proteins of the
CC       neuroexocytosis apparatus, synaptobrevins, SNAP25 or syntaxin. No
```

```
CC       detected action on small molecule substrates.
CC   -!- COFACTOR: Binds 1 zinc ion per subunit (By similarity).
CC   -!- SUBUNIT: Disulfide-linked heterodimer of a light chain (L) and a
CC       heavy chain (H). The light chain has the pharmacological activity,
CC       while the N- and C-terminal of the heavy chain mediate channel
CC       formation and toxin binding, respectively.
CC   -!- SUBCELLULAR LOCATION: Secreted.
CC   -!- MISCELLANEOUS: There are seven antigenically distinct forms of
CC       botulinum neurotoxin: Types A, B, C1, D, E, F, and G.
CC   -!- SIMILARITY: Belongs to peptidase family M27.

CC   -!- FUNCTION: BOTULINUS TOXIN ACTS BY INHIBITING NEUROTRANSMITTER
CC       RELEASE. IT BINDS TO PERIPHERAL NEURONAL SYNAPSES, IS INTERNALIZED
CC       AND MOVES BY RETROGRADE TRANSPORT UP THE AXON INTO THE SPINAL CORD
CC       WHERE IT CAN MOVE BETWEEN POSTSYNAPTIC AND PRESYNAPTIC NEURONS. IT
CC       INHIBITS NEUROTRANSMITTER RELEASE BY ACTING AS A ZINC
CC       ENDOPEPTIDASE.
CC   -!- CATALYTIC ACTIVITY: Limited hydrolysis of proteins of the
CC       neuroexocytosis apparatus, synaptobrevins, SNAP25 or syntaxin. No
CC       detected action on small molecule substrates.
CC   -!- COFACTOR: Binds 1 zinc ion per subunit (By similarity).
```

```
CC   -!- SUBUNIT: Disulfide-linked heterodimer of a light chain (L) and a
CC       heavy chain (H). The light chain has the pharmacological activity,
CC       while the N- and C-terminal of the heavy chain mediate channel
CC       formation and toxin binding, respectively.
CC   -!- SUBCELLULAR LOCATION: Secreted.
CC   -!- MISCELLANEOUS: There are seven antigenically distinct forms of
CC       botulinum neurotoxin: Types A, B, C1, D, E, F, and G.
CC   -!- SIMILARITY: Belongs to peptidase family M27.

CC   -!- FUNCTION: Inhibits acetylcholine release. The botulinum toxin
CC       binds with high affinity to peripheral neuronal presynaptic
CC       membrane, is then internalized by receptor-mediated endocytosis.
CC       The C-terminus of the heavy chain (H) is responsible for the
CC       adherence of the toxin to the cell surface while the N-terminus
CC       mediates transport of the light chain from the endocytic vesicle
CC       to the cytosol. After translocation, the light chain (L)
CC       hydrolyzes the 197-Gln-|-Arg-198 bond in SNAP-25, thereby blocking
CC       neurotransmitter release. Inhibition of acetylcholine release
CC       results in flaccid paralysis, with frequent heart or respiratory
CC       failure.
CC   -!- CATALYTIC ACTIVITY: Limited hydrolysis of proteins of the
CC       neuroexocytosis apparatus, synaptobrevins, SNAP25 or syntaxin. No
CC       detected action on small molecule substrates.
CC   -!- COFACTOR: Binds 1 zinc ion per subunit.
CC   -!- SUBUNIT: Disulfide-linked heterodimer of a light chain (L) and a
CC       heavy chain (H).
CC   -!- SUBCELLULAR LOCATION: Secreted.
CC   -!- PHARMACEUTICAL: Available under the name BOTOX (Allergan) for
CC       the treatment of strabismus and blepharospasm associated with
CC       dystonia and cervical dystonia. Also used for the treatment of
CC       hemifacial spasm and a number of other neurological disorders
CC       characterized by abnormal muscle contraction.
CC   -!- MISCELLANEOUS: There are seven antigenically distinct forms of
CC       botulinum neurotoxin: Types A, B, C1, D, E, F, and G.
CC   -!- SIMILARITY: Belongs to peptidase family M27.

RT   gene encoding the nontoxic nonhemagglutinin component.";
RL   Int. J. Syst. Bacteriol. 46:1105-1112(1996).
CC   -!- FUNCTION: Inhibits acetylcholine release. The botulinum toxin
CC       binds with high affinity to peripheral neuronal presynaptic
CC       membrane, is then internalized by receptor-mediated endocytosis.
CC       The C-terminus of the heavy chain (H) is responsible for the
CC       adherence of the toxin to the cell surface while the N-terminus
CC       mediates transport of the light chain from the endocytic vesicle
CC       to the cytosol. After translocation, the light chain (L)
CC       hydrolyzes the 197-Gln-|-Arg-198 bond in SNAP-25, thereby blocking
CC       neurotransmitter release. Inhibition of acetylcholine release
CC       results in flaccid paralysis, with frequent heart or respiratory
CC       failure (By similarity).
CC   -!- CATALYTIC ACTIVITY: Limited hydrolysis of proteins of the
CC       neuroexocytosis apparatus, synaptobrevins, SNAP25 or syntaxin. No
CC       detected action on small molecule substrates.
CC   -!- SUBUNIT: Disulfide-linked heterodimer of a light chain (L) and a
CC       heavy chain (H) (By similarity).
CC   -!- SUBCELLULAR LOCATION: Secreted.
CC   -!- MISCELLANEOUS: There are seven antigenically distinct forms of
CC       botulinum neurotoxin: Types A, B, C1, D, E, F, and G.
CC   -!- SIMILARITY: Belongs to peptidase family M27.

CC   -!- FUNCTION: BOTULINUS TOXIN ACTS BY INHIBITING NEUROTRANSMITTER
CC       RELEASE. IT BINDS TO PERIPHERAL NEURONAL SYNAPSES, IS INTERNALIZED
CC       AND MOVES BY RETROGRADE TRANSPORT UP THE AXON INTO THE SPINAL CORD
CC       WHERE IT CAN MOVE BETWEEN POSTSYNAPTIC AND PRESYNAPTIC NEURONS. IT
CC       INHIBITS NEUROTRANSMITTER RELEASE BY ACTING AS A ZINC
CC       ENDOPEPTIDASE THAT CLEAVES THE 76-GLN-|-PHE-77 BOND OF
CC       SYNAPTOBREVIN-2.
CC   -!- CATALYTIC ACTIVITY: Limited hydrolysis of proteins of the
CC       neuroexocytosis apparatus, synaptobrevins, SNAP25 or syntaxin. No
CC       detected action on small molecule substrates.
CC   -!- COFACTOR: Binds 1 zinc ion per subunit (By similarity).
CC   -!- SUBUNIT: Disulfide-linked heterodimer of a light chain (L) and a
CC       heavy chain (H). The light chain has the pharmacological activity,
CC       while the N- and C-terminal of the heavy chain mediate channel
CC       formation and toxin binding, respectively.
CC   -!- SUBCELLULAR LOCATION: Secreted.
CC   -!- MISCELLANEOUS: There are seven antigenically distinct forms of
CC       botulinum neurotoxin: Types A, B, C1, D, E, F, and G.
CC   -!- SIMILARITY: Belongs to peptidase family M27.

DE Botulinum neurotoxin type G precursor (EC 3.4.24.69) (BoNT/G)
DE (Bontoxilysin G).
GN BOTG.
OS Clostridium botulinum.
OC Bacteria; Firmicutes; Clostridia; Clostridiales; Clostridiaceae;
OC Clostridium.
OX NCBI_TaxID=1491;
RN [1]
RP SEQUENCE FROM N.A.
RC STRAIN=113 / 30;
RX MEDLINE=94092745; PubMed=8268233;
RA Campbell K., Collins M.D., East A.K.;
RT "Nucleotide sequence of the gene coding for Clostridium botulinum
RT (Clostridium argentinense) type G neurotoxin: genealogical comparison
RT with other clostridial neurotoxins.";
RL Biochim. Biophys. Acta 1216:487-491(1993).
CC -!- FUNCTION: BOTULINUS TOXIN ACTS BY INHIBITING NEUROTRANSMITTER
CC RELEASE. IT BINDS TO PERIPHERAL NEURONAL SYNAPSES, IS INTERNALIZED
CC AND MOVES BY RETROGRADE TRANSPORT UP THE AXON INTO THE SPINAL CORD
CC WHERE IT CAN MOVE BETWEEN POSTSYNAPTIC AND PRESYNAPTIC NEURONS. IT
CC INHIBITS NEUROTRANSMITTER RELEASE BY ACTING AS A ZINC
CC ENDOPEPTIDASE.
CC -!- CATALYTIC ACTIVITY: Limited hydrolysis of proteins of the
CC neuroexocytosis apparatus, synaptobrevins, SNAP25 or syntaxin. No
CC detected action on small molecule substrates.
CC -!- COFACTOR: Binds 1 zinc ion per subunit (By similarity).
CC -!- SUBUNIT: Disulfide-linked heterodimer of a light chain (L) and a
CC heavy chain (H). The light chain has the pharmacological activity,
CC while the N- and C-terminal of the heavy chain mediate channel
CC formation and toxin binding, respectively.
CC -!- SUBCELLULAR LOCATION: Secreted (By similarity).
CC -!- MISCELLANEOUS: There are seven antigenically distinct forms of
CC botulinum neurotoxin: Types A, B, C1, D, E, F, and G.
CC -!- SIMILARITY: Belongs to peptidase family M27.

CC   -!- FUNCTION: TETANUS TOXIN ACTS BY INHIBITING NEUROTRANSMITTER
CC       RELEASE. IT BINDS TO PERIPHERAL NEURONAL SYNAPSES, IS INTERNALIZED
CC       AND MOVES BY RETROGRADE TRANSPORT UP THE AXON INTO THE SPINAL CORD
CC       WHERE IT CAN MOVE BETWEEN POSTSYNAPTIC AND PRESYNAPTIC NEURONS. IT
CC       INHIBITS NEUROTRANSMITTER RELEASE BY ACTING AS A ZINC
CC       ENDOPEPTIDASE THAT CATALYZES THE HYDROLYSIS OF THE 76-GLN-|-PHE-77
CC       BOND OF SYNAPTOBREVIN-2.
CC   -!- CATALYTIC ACTIVITY: Hydrolysis of 76-Gln-|-Phe-77 bond in
CC       synaptobrevin 2.
CC   -!- COFACTOR: Binds 1 zinc ion per subunit (By similarity).
CC   -!- SUBUNIT: THE PRECURSOR POLYPEPTIDE IS SUBSEQUENTLY CLEAVED TO
CC       YIELD SUBCHAINS L AND H. THESE REMAIN LINKED BY A DISULFIDE BRIDGE
CC       AND ARE NON-TOXIC AFTER SEPARATION.
CC   -!- MISCELLANEOUS: THE C-TERMINAL OF THE HEAVY CHAIN BINDS TO
CC       GANGLIOSIDE RECEPTORS.
CC   -!- SIMILARITY: Belongs to peptidase family M27.

RL   EMBO J. 12:4821-4828(1993).
CC   -!- FUNCTION: BOTULINUS TOXIN ACTS BY INHIBITING NEUROTRANSMITTER
CC   RELEASE. IT BINDS TO PERIPHERAL NEURONAL SYNAPSES, IS INTERNALIZED
CC   AND MOVES BY RETROGRADE TRANSPORT UP THE AXON INTO THE SPINAL CORD
CC   WHERE IT CAN MOVE BETWEEN POSTSYNAPTIC AND PRESYNAPTIC NEURONS. IT
CC   INHIBITS NEUROTRANSMITTER RELEASE BY ACTING AS A ZINC
CC   ENDOPEPTIDASE THAT CLEAVES SYNTAXIN.
CC   -!- CATALYTIC ACTIVITY: Limited hydrolysis of proteins of the
CC   neuroexocytosis apparatus, synaptobrevins, SNAP25 or syntaxin. No
CC   detected action on small molecule substrates.
CC   -!- COFACTOR: Binds 1 zinc ion per subunit (By similarity).
CC   -!- SUBUNIT: Disulfide-linked heterodimer of a light chain (L) and a
CC   heavy chain (H). The light chain has the pharmacological activity,
CC   while the N- and C-terminal of the heavy chain mediate channel
CC   formation and toxin binding, respectively.

```
CC   -!- SUBCELLULAR LOCATION: Secreted.
CC   -!- MISCELLANEOUS: There are seven antigenically distinct forms of
CC       botulinum neurotoxin: Types A, B, C1, D, E, F, and G.
CC   -!- MISCELLANEOUS: BOTULINUM TYPE C1 NEUROTOXIN IS SYNTHESIZED BY C
CC       STRAIN OF CLOSTRIDIUM BOTULINUM WHICH CARRY THE APPROPRIATE
CC       BACTERIOPHAGE.
CC   -!- SIMILARITY: Belongs to peptidase family M27.

RT   "Characterization of the gene encoding the largest subunit of
RT   Plasmodium falciparum RNA polymerase III.";
RL   Mol. Biochem. Parasitol. 46:229-240(1991).
CC   -!- FUNCTION: DNA-dependent RNA polymerase catalyzes the transcription
```

```
CC       of DNA into RNA using the four ribonucleoside triphosphates as
CC       substrates.
CC   -!- CATALYTIC ACTIVITY: N nucleoside triphosphate = N diphosphate +
CC       (RNA)(N).
CC   -!- SUBUNIT: RNA polymerase III consists of about 15 different
CC       subunits. This subunit is the largest component of RNA polymerase
CC       III.
CC   -!- SUBCELLULAR LOCATION: Nuclear.
CC   -!- MISCELLANEOUS: Three distinct zinc-containing RNA polymerases are
CC       found in eukaryotic nuclei: polymerase I for the ribosomal RNA
CC       precursor, polymerase II for the mRNA precursor, and polymerase
CC       III for 5S and tRNA genes.
CC   -!- SIMILARITY: Belongs to the RNA polymerase beta' chain family.

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

PT Novel nucleic acid molecule encoding botulinum neurotoxin light chain
PT serotype A, useful for producing the neurotoxin for vaccination against
PT botulism, comprises sequence expressible in host other than Clostridium.
XX
PS Claim 52; Page 162-164; 166pp; English.
XX
CC The invention relates to a nucleic acid molecule encoding a botulinum
CC neurotoxin light chain (BoNT LC) serotype A, where the DNA has a sequence
CC that is expressible in a host organism other than Clostridium, or has a
CC total A+T content that is less than about 70% The BoNT LC protein is
CC useful in vaccination against botulism, for eliciting protective immunity
CC in a mammal, for treating dystonias, spasticity, pain, ocular motility,

```
CC   facial dyskinesias, stiff-person syndrome, bladder dysfunction, segmental
CC   myoclonus, hyperkinetic disorders, cosmetic treatment of facial wrinkles,
CC   conditions characterised by hyperactivity of the lower motor neuron, and
CC   to control autonomic nerve function or tiptoe-walking due to stiff
CC   muscles common in children with cerebral palsy. The sequences are also
CC   useful for screening for botulinum neurotoxin inhibitors. This sequence
CC   represents a botulinum neurotoxin light chain serotype A protein

PT   Novel Botulinum neurotoxin vaccine comprising a fragment from botulinum
PT   toxin serotypes A-G, is used for inducing an immune response against
PT   botulinum.
XX
PS   Claim 28; Page 47-48; 54pp; English.
XX
CC   The invention relates to novel vaccines that induce a protective immune
CC   response against botulinum neurotoxin (BoNT) serotypes A, B, C, D, E, F
CC   and G (BoNTA-BoNTG). The vaccine of the invention is novel recombinant
CC   DNA construct comprising a vector, and at least one nucleic acid fragment
CC   comprising a C-terminal heavy chain fragment (Hc) from BoNT serotypes A-
CC   G. In preferred embodiments of the invention, the vector is a Venezuelan
CC   equine encephalitis virus (VEE) replicon vector. Use of this vector
CC   results in the production of large amounts of a protein encoded by a
CC   sequence cloned into the replicon. The constructs are used to produce
CC   vaccines against botulism. The proteins can also be used as diagnostic
CC   tools for the diagnosis of botulism. The transformed host cells can be
CC   used to analyse the effectiveness of drugs and agents which inhibit toxin
CC   effects. The vaccine currently used against botulism is dangerous and
CC   expensive to produce, and contains formalin, which is very painful for
CC   the recipient. Also, the vaccine is incomplete, in that only 5 of the 7
CC   serotypes are represented in the formulation. The novel vaccine of
CC   overcomes these problems, as it is easily purified, and available in
CC   large quantities. It is also expressed in the lymph nodes for a better
CC   immune response. Sequences AAY77134-Y77139 represent synthetic BoNT Hc
CC   fragments used in the present invention. The DNA encoding these sequences
CC   had been optimised for codon usage for expression in yeast

PT New nucleic acids encoding the carboxy- or amino-terminal portions of the
PT heavy chain of botulinum neurotoxin of serotype A-G, useful as vaccine
PT against botulism.
XX
PS Claim 3; Fig 10b; 73pp; English.
XX
CC Botulism neurotoxins are translated as a single 150 kDa polypeptide chain
CC and then posttranslationally nicked, forming a dichain consisting of a
CC 100 kDa heavy chain and a 50 kDa light chain which remain linked by a
CC disulfide bond. Nucleic acids encoding the carboxy-terminal (HC) or amino
CC -terminal (HN) portion of the heavy chain of botulinum neurotoxin (BoNT)
CC can be used in recombinant expression vectors and expressed in
CC transformed cells to produce peptide antigens useful for eliciting an
CC immune response to give protective immunity against botulinum neurotoxin,
CC which causes botulism. The nucleic acids are expressible in a recombinant
CC organisms such as Escherichia coli or Pichia pastoris. The use of
CC recombinant nucleic acids are advantageous since it eliminates the need
CC to culture large quantities of hazardous toxin-producing bacterium.
CC Production yield from the genetically engineered product is also high and
CC cost of production is lower. The nucleic acids can be derived from
CC Clostridium botulinum serotypes A-G

PT   Host cell containing recombinant expression vector encoding Clostridium
PT   botulinum type B or E toxin - useful to treat humans and other animals at
PT   risk of intoxication with clostridial toxin.
XX
PS   Example 49; Page 376-378; 428pp; English.
XX
CC   This is the amino acid sequence of the histidine-tagged C fragment of
CC   Clostridium botulinum (113/30 strain) type G neurotoxin, encoded by a DNA
CC   sequence (see AAV30596) in plasmid pETHisb. This vector can be used to
CC   express BotG soluble C fragment in Escherichia coli host cells, with the
CC   recombinant C fragment being purified on an affinity column. The
CC   invention relates to recombinant proteins derived from C. botulinum
CC   toxins, especially type B and type E toxins. Methods are provided which
CC   allow for the isolation of soluble recombinant proteins free of
CC   significant endotoxin contamination. Preferred hosts for production of
CC   recombinant proteins are E. coli, insect cells and yeast cells. The
CC   recombinant toxins are used as immunogens for the production of vaccines
CC   and antitoxins that are useful in the treatment of humans and animals at
CC   risk of intoxication with clostridial toxin

PT   Novel nucleic acid molecule encoding botulinum neurotoxin light chain
PT   serotype A, useful for producing the neurotoxin for vaccination against
PT   botulism, comprises sequence expressible in host other than Clostridium.
XX
PS   Claim 33; Page 160-161; 166pp; English.
XX
CC   The invention relates to a nucleic acid molecule encoding a botulinum
CC   neurotoxin light chain (BoNT LC) serotype A, where the DNA has a sequence
CC   that is expressible in a host organism other than Clostridium, or has a
CC   total A+T content that is less than about 70% The BoNT LC protein is
CC   useful in vaccination against botulism, for eliciting protective immunity
CC   in a mammal, for treating dystonias, spasticity, pain, ocular motility,
CC   facial dyskinesias, stiff-person syndrome, bladder dysfunction, segmental
CC   myoclonus, hyperkinetic disorders, cosmetic treatment of facial wrinkles,
CC   conditions characterised by hyperactivity of the lower motor neuron, and
CC   to control autonomic nerve function or tiptoe-walking due to stiff
CC   muscles common in children with cerebral palsy. The sequences are also
CC   useful for screening for botulinum neurotoxin inhibitors. This sequence
CC   represents a botulinum neurotoxin light chain serotype A protein

PT Novel modified neurotoxin with a structural modification that alters
PT biological persistence or activity of the modified neurotoxin relative to
PT the unmodified neurotoxin, for treating tremors, bruxism and dysphagia.
XX
PS Disclosure; Fig 8; 33pp; English.
XX
CC The invention describes a modified neurotoxin (I) comprising a structural
CC modification that alters the biological persistence or biological
CC activity of the modified neurotoxin relative to an identical neurotoxin
CC without the structural modification (the modified neurotoxin is
CC structurally different from a naturally existing neurotoxin). (I) which
CC has altered biological persistence, is useful for treating a condition in
CC a mammal, where the neurotoxin does not comprise a leucine-based motif,
CC and the structural modification includes a biological persistence
CC enhancing component which comprises a leucine-based motif, tyrosine-based
CC motif or an amino acid derivative. (I) is useful for treating a condition
CC such as neuromuscular disorder, autonomic disorder or pain, or spasmodic
CC dysphonia, laryngeal dystonia, oromandibular dysphonia, lingual dystonia,
CC cervical dystonia, focal hand dystonia, blepharospasm, strabismus,
CC hemifacial spasm, eyelid disorder, cerebral palsy, focal spasticity,
CC spasmodic colitis, neurogenic bladder, anismus, limb spasticity, tics,
CC tremors, bruxism, anal fissure, achalasia, dysphagia, lacrimation,
CC hyperhydrosis, excessive salivation, excessive gastrointestinal
CC secretions, pain from muscle spasms, headache pain, brow furrows and skin
CC wrinkles. (I) is also useful for treating spinal curvature, various forms
CC of inflammatory pains, autonomic nervous system disorders, e,g., an
CC respiratory malfunctioning such as chronic obstructive pulmonary disease,
CC and asthma; pain not associated with a muscular disorder, such as spasm.
CC A unit amount of modified neurotoxin having altered biological activity
CC than natural neurotoxin, is more efficient to reduce exocytosis from a
CC cell than is a unit amount of naturally existing neurotoxin. This is the
CC amino acid sequence of a botulinum type toxin B Danish I light chain used
CC to determine a consensus sequence for Botulinum toxin

XX
CC The present sequence represents a recombinant neurotoxin protein from the
CC present invention. The present invention describes recombinant neurotoxin
CC proteins which comprise a first and second domain, where the first domain
CC is adapted to cleave one or more vesicle or plasma-membrane associated
CC proteins essential to exocytosis, and where the second domain is adapted:
CC (a) to translocate the protein into a cell; (b) to increase the
CC solubility of the protein compared to the solubility of the first domain
CC on its own, or (c) both to translocate the protein into a cell and to
CC increase the solubility of the protein compared to the solubility of the
CC first domain on its own, the protein being free of clostridial neurotoxin
CC (CN) and free of CN precursor that can be converted into toxin by
CC proteolytic action. The recombinant proteins can be used as therapeutic
CC agents for targeting cells expressing a relevant substrate. The products
CC can also be used as immunogens and as non-toxic standards for the
CC assessment and development of in vitro assays for the detection of
CC functional botulinum or tetanus neurotoxins either in foodstuffs or in
CC environmental samples

PT Recombinant neurotoxin polypeptides - used to develop therapeutic agents,
PT immunogens or as non-toxic standards for the detection of neurotoxins.

XX
PS Example 2; Page 91-94; 137pp; English.
XX
CC The present sequence represents a recombinant neurotoxin protein from the
CC present invention. The present invention describes recombinant neurotoxin
CC proteins which comprise a first and second domain, where the first domain
CC is adapted to cleave one or more vesicle or plasma-membrane associated
CC proteins essential to exocytosis, and where the second domain is adapted:
CC (a) to translocate the protein into a cell; (b) to increase the
CC solubility of the protein compared to the solubility of the first domain
CC on its own, or (c) both to translocate the protein into a cell and to
CC increase the solubility of the protein compared to the solubility of the
CC first domain on its own, the protein being free of clostridial neurotoxin
CC (CN) and free of CN precursor that can be converted into toxin by
CC proteolytic action. The recombinant proteins can be used as therapeutic
CC agents for targeting cells expressing a relevant substrate. The products
CC can also be used as immunogens and as non-toxic standards for the
CC assessment and development of in vitro assays for the detection of
CC functional botulinum or tetanus neurotoxins either in foodstuffs or in
CC environmental samples

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

RT "Nucleotide sequence of the gene coding for Clostridium botulinum
RT (Clostridium argentinense) type G neurotoxin: genealogical comparison
RT with other clostridial neurotoxins.";
RL Biochim. Biophys. Acta 1216:487-491(1993).
CC -!- FUNCTION: BOTULINUS TOXIN ACTS BY INHIBITING NEUROTRANSMITTER
CC RELEASE. IT BINDS TO PERIPHERAL NEURONAL SYNAPSES, IS INTERNALIZED
CC AND MOVES BY RETROGRADE TRANSPORT UP THE AXON INTO THE SPINAL CORD
CC WHERE IT CAN MOVE BETWEEN POSTSYNAPTIC AND PRESYNAPTIC NEURONS. IT
CC INHIBITS NEUROTRANSMITTER RELEASE BY ACTING AS A ZINC
CC ENDOPEPTIDASE.
CC -!- CATALYTIC ACTIVITY: Limited hydrolysis of proteins of the
CC neuroexocytosis apparatus, synaptobrevins, SNAP25 or syntaxin. No
CC detected action on small molecule substrates.
CC -!- COFACTOR: Binds 1 zinc ion per subunit (By similarity).
CC -!- SUBUNIT: Disulfide-linked heterodimer of a light chain (L) and a
CC heavy chain (H). The light chain has the pharmacological activity,
CC while the N- and C-terminal of the heavy chain mediate channel
CC formation and toxin binding, respectively.
CC -!- SUBCELLULAR LOCATION: Secreted (By similarity).
CC -!- MISCELLANEOUS: There are seven antigenically distinct forms of
CC botulinum neurotoxin: Types A, B, C1, D, E, F, and G.
CC -!- SIMILARITY: Belongs to peptidase family M27.

CC   -!- FUNCTION: TETANUS TOXIN ACTS BY INHIBITING NEUROTRANSMITTER
CC       RELEASE. IT BINDS TO PERIPHERAL NEURONAL SYNAPSES, IS INTERNALIZED
CC       AND MOVES BY RETROGRADE TRANSPORT UP THE AXON INTO THE SPINAL CORD
CC       WHERE IT CAN MOVE BETWEEN POSTSYNAPTIC AND PRESYNAPTIC NEURONS. IT
CC       INHIBITS NEUROTRANSMITTER RELEASE BY ACTING AS A ZINC
CC       ENDOPEPTIDASE THAT CATALYZES THE HYDROLYSIS OF THE 76-GLN-|-PHE-77
CC       BOND OF SYNAPTOBREVIN-2.
CC   -!- CATALYTIC ACTIVITY: Hydrolysis of 76-Gln-|-Phe-77 bond in
CC       synaptobrevin 2.
CC   -!- COFACTOR: Binds 1 zinc ion per subunit (By similarity).
CC   -!- SUBUNIT: THE PRECURSOR POLYPEPTIDE IS SUBSEQUENTLY CLEAVED TO
CC       YIELD SUBCHAINS L AND H. THESE REMAIN LINKED BY A DISULFIDE BRIDGE
CC       AND ARE NON-TOXIC AFTER SEPARATION.
CC   -!- MISCELLANEOUS: THE C-TERMINAL OF THE HEAVY CHAIN BINDS TO
CC       GANGLIOSIDE RECEPTORS.
CC   -!- SIMILARITY: Belongs to peptidase family M27.
